: This question comes up almost every month, should be a FAQ or testing
: question for amateur exams

Sorry about that, I did try on Google (web and usenet) but found surprisingly little info on the topic. I think it would help a bit if rig manufacturers mentioned the mode(s) in their brochures and/or webpages :)

: Most new transceivers support iambic mode B for their electronic keyers.
: Some allow you to change to mode A, others do not.

Thanks to you and all the others who responded; looks like I might do wisely to change to mode B before I grow too accustomed to mode A (just 50 QSOs at 16wpm, shouldn't be too hard yet).

Dan, go with the BayGen Freeplay model.
The latest versions, meaning ones that are
new in the box on retail sale right now, have
an improved mechanical spring which powers
the generator. Older BayGens had problems
with metal fatigue of the spring which is difficult to
get outside of South Africa, and expensive to replace.
Get the Baygen. STAY AWAY from the China-made
copies!! They are absolute 100% JUNK - period.
Sony made a wind up model but I havent had one
to review yet. Stay with the BayGen products and your
soon to be (?) XYL will have many hours of
troublefree operation.

I say we give each and every Luke wind-up to the Taliban.

It has to be the absolute worst piece of junk I've seen come
out of the China "we-copy-a-radio-for-cheap" factory to date.

Better idea is to strap all the Luke Shortwaves onto the pallets
they drop the Daisy Cutter bombs off/out of a C-130, so when it
explodes the flying bits of Luke Shortwaves will act as shrapnel.

Funny thought: "Osama Bin Laden killed via bits of propelled Luke
Shortwave shrapnel bits from a future Daisy-Cutter offloading mission...."

As I said in mail, 2000 Ranger so I dont have Ashtray space like that :). The area in front of the seat is where my HF will go when I get to that point.

But the 2mtr now has a nice home, got it finished last night. Someone said the velcro would not hold if I used a ceiling mount so I went to a dash mount. Since the rig is so small if fit right to the left of the steering wheel. The patch of velcro is not obstrusive and the cords ran fine right to that spot.

Thanks for all the help and comments.

I have for sale an absolutely mint Kenwood TS-850SAT. I am the original non smoking owner. I have both shipping boxes, hand mic, owners manuals and unopened accessory bag. The radio is a 10 out of a 10 functionally and cosmetically. The radio includes the SO-2 TCXO unit which is a $180.00 option. This is one of the last 850's manufactured. The serial number is 80200024. This is most likely one of the finest 850's you will find. I am asking $950.00 shipped ground UPS CONUS.

5745. FS: ICOM IC_471H

Hi Bob,

I know what you mean about muffled sound. I presently have a Kenwood TS-440S, with the 1.8 SSB (narrow) filter. Without DSP or PBT on the 440, I got used to that sound when I needed to elimiate QRM. I think I'll get a 1.9 MHz as a safeguard, though the PBT will probably be heavily used.

Thanks.

74, de Joel H. (N0AOM)

FS or trade list update
GE MPA VHF System, Aegis encrypted. My personal radio that works 100%. I would rate it a 9 on looks. Has a good battery and a rapid charger. $375.00
GE MPD UHF select. 48 channel alphanumeric display with battery and charger. I am using this radio on the ham band now. $100.00
GE PCS VHF 136-150 2 channel. Ham band PCS with good battery and charger. $75.00
GE TPX with keypad 800 MHz. I have 2 of these with batteries. $35.00 pair.
GE KPC-300 VHF 16 channel scan. 9 out of 10 condition. With battery and charger. $175.00
GE Ranger UHF 403-420 100 watt. $25.00
GE Mastr II Repeater. 75 continuos duty. 4 cavity GE/Decibel pass/reject Duplexer, 32 amp Mastr II supply, factory encode and decode cards, Com card, Metering card, and all in a Desk-mate case. Also has 1 set of 2C Icom's. $850.00
GE Mastr II Mobile UHF 75 watt Painted handle. UHS pre-amp, $75.00
GE Mastr Exec II VHF Mobile repeater. $25.00
GE TMX 8612 with hand set and mounted on a mobile platform like a cell phone. $25.00
GE Public safety speaker mic for MPA, MPD, MTL, and TPX. $35.00
GE Speaker mic for MPA, MPD, MTL, and TPX. $25.00
GE Batteries for MPS, 1200 Mah. NOS. $25.00 Also new replacement antennas for MPS $15.00
GE Mastr II 8 channel control cables. $10.00
GE Mastr II control head. $6.00
GE Mastr II Mic. $5.00
GE Mastr II tone boards.$5.00
GE Mastr II Mic hang-up box. $5.00
GE Delta/s mounting plate.$8.00
GE 9600 Voice Guard Boxes. $10.00
GE Ranger / Delta downloading cables. $40.00
GE White Versatone filters. I have a few in the 103.5 - 203.5 range. $4.00 each
Terms
Shipping is paid by buyer. Insurance is the buyers choice but if you do not insure the package once it is mailed I have no more responsibility.
I take trades. Ask I may want it but not likely if it is not GE or Ham related. Still looking for MPS programming proms
Dean

The FCC does not care how you get to any power level as long as you stay with the legal limit. YOu can build or modify any equipment to get to the ham bands. You just need to be sure they do not put out any spurious signals. Some of the tube amps can be reworked for 6 meters. Just be sure to add plenty of filtering on the output as most of the cb type amps don't have much if any filtering and even if they do the filters should cut off below 6 meters.

Well, as a ham, if you can work out the technical details, (i.e.
spurious emissions) you should have the legal ones covered already.

The main problem is that those will probably cost as much as, or more
than a legit ham amp, and will require a lot more fiddling to make
them work right.

No flame, here.

Some 10 meter amplifiers can be moved up frequency to 6 meters, BUT
that is not automatic yes. Most of these conversions turn the amplifier
into a 6 meter only amplifier. Spatial purity is a MUST at 50 - 54 MHz.

You have two radio services and one utility that frown upon interference
above 30 MHz
1.) The public service - police, fire, hospitals - that still use the 30 -
50 MHz
commercial segment in many parts of the country.
2.) Your neighbors - TX channel 2 is right above the 6 meter band. For your
newcomers,
the amateur 6 meter band occupies the "old TV Channel 1" allocation.
3.) You local cable TV company. You will find the breaks and problems in
their
city distribution cable systems - and so will everyone watching in that
area.

There are a number of web sites (yahoo and goggle searches) that
show various 6 meter conversions of amplifiers performed by individual
amateurs.

I have seen a SB-230 (the convection cooled tube) successfully converted
back
in the early 1980's

If you're inclined to put something together, THe Smirk Tech. page
has some Amps. the size you're looking for.. Instead of building from
scratch, you could find a dead 10/11m amp and use that as a place
to start from.. The MRF492 transistor will pretty much do what you
want it to do.. 10W in - 75w out..

See http://www.6mt.com/6tech.htm

Make sure you are running tone squelch only on transmit, and not on receive, unless the repeater is transmitting PL! Many systems require the sub audible tone for access, but do not transmit the tone. If you are running PL receive, you will not hear signals unless the subaudible tone is present.

For information on the CP-1, see
http://www.angelfire.com/fl3/technicothica/cp1.html

It is a great site dedicated to the CP-1 and CP-100. Lots of great mods and
links for software!

Yes, with some FREEWARE, you can even use your CP-1 for PACTOR!!

Amateur Customer Service: customerservice@vxstdusa.com

Jerry Darby, N6UME works in their Technical Support
department for the Amateur Products Division
at (562) 404-2700 Ext. 244

Yaesu has been ALWAYS been responsive to my e-mail inquiries.
I usually have an e-mail or telephone response by the next day,
unless they get swamped (FT-100 returns & repairs !).

If I need a rush answer, I call my dealer (where I bought it) service
manager.

I'll tell you what, volunteer one day at their e-mail and telephone support
lines and
you have a whole new appreciation for the job - given their resources.

Their web site is totally coordinated from Japan, little input for the U.S.
staff, service & support.

5774. Re: "low" power 6 meter amps? Where can I get one?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-10 03:38:22 UTC
From: Frizz <KG4IVT@hotmail.spamsucks.leaveme.alone.com>
Message-ID: <Oi1H7.14201$9f4.2045765@typhoon.southeast.rr.com>
Source record: 52177

The 6 meter conversion is no biggie here as I am still a tech at the moment working on my general. I have an old, AC powered amplifier that was given to me with two 6LQ6 sweep tubes in it. It says it is a 6 meter amp on the front but a coil tap on the inside was moved over several spaces. I have since moved the tap back to where I believe it was originally. I don't think there is any filtering on the output so that's probably where I would have to start on making this thing work. Hmm.....

It was made by Fist Commercial Communications, btw. Thanks group!

Hello,

I am in need of some help.....
I have an SMC 2520 Band 3 radio and I am looking to convert it.
Has any one done this with one before ?
if so what did you do and on to which band ?
Also has any one got a manual / circuit details and or an
address for Argyle communications whom I believe had some thing
to do with the design / programming of the rig..

Ta.
Martin

Wanted to get into satellites but lost interest! 2meter/440 rig, all modes SSB, CW, FM.

It's a great rig ....9 out of 10. With the tone unit, manual and hand mike. This is a super satellite station! It is not a compromise between HF and V/UHF. It was designed for satellite operation.

Price $735 shipped Conus....Contact: n2tu@optonline.net

Thank you for your suggestion and praises for Yaesu. I haven't had the good luck in getting response from them that apparently others have had, but can find no fault in that things may be quite hectic as one respondent said. I have e-mailed directly amateurtech@vxstdusa.com as suggested. The dealer where I purchased the transceiver a few years back is no longer in business. Many thanks, and hopefully, this will bring me better news . My appreciation to all of you who have shown what ham radio is all about....working with each other to enhance and enjoy our hobby.

Hello,

I have a spare SK-506 that I would swap for your SK-516. I really
thought the tubes used the same chimney. What is the difference?

How would you like to handle the exchange?

Nick,
I'd recommend Mal Eiselman NC4L in Hollywood Fla. He's worked on my
FT-102 and it came out superb! He's probably the worlds foremost expert on
FT-102's. Look for his email adddress on QRZ.

Thanks to Willis, Greg Beat, and Mark Keith for constructive comments.

My guess also was that the previous owner simply used too much drive at
some point, or perhaps somehow got the amp to oscillate.

Well, another local ham happened to have several resistors of the right
ratings, so I went ahead and put them in, and the amp seems to be fine.
Power input is a bit low on the 15-meter band, but I hope that'll be
fixed with a little tweaking, which I'll do this weekend.

Yes, I've had similar results, but I did get an answer after about
3 to 4 weeks. They did make an attempt to answer to my technical
questions, however I finally was able to fix my radio myself by
then. I've had much better experience with the techs on the
phone in the past, but I must admit that was several years ago.

It's shame ... I really have always liked Yaesu products ... I sure
wish they could make their tech support efforts at least passable,
preferably example-setting.

Not sure about 572 tubes--but blown grid resistors could indicate a VHF
parasitic oscillation and related arc-over damage.

It's capable of pretty decent SW reception.. but not as good as a dedicated SW receiver. And it's nearly worthless on any band under 150MHz with the stock antenna. I use a telescoping whip on mine, about 36" fully extended, and it does a pretty admirable job..

I have the opportunity to buy a very clean Atlas 350XC with the "on-board"
2nd VFO option, with matching. pwr supply/speaker.

I want to crystal the unit up for Army MARS, which is within its capability.

Was this a pretty decent unit? How did it stack up against the Ten-Tec's of
the day. I would like something U.S. made, non-synthesized.

Any comments, ideas, or guesstimate of value?

Tnx es 73
Tom . .

You might do better by getting a 4 - 7 amp-hour gel cell battery.
They are often available at hamfests for about $10 in new and good
condition, less if it was pulled from an alarm or other system where
used as a backup power source. Another option is to make a battery
pack for C or D cells using stock battery holders. You would need to
put a few holders in series as I don't know of any that hold 8
batteries. The gel cell will likely be more compact though.

Hope this helps,
Howard KE6MAK

I'd recommend the VX-5R if you have to go small but personally I want options. I'd say try the Icom W32A.

When one of the 33 ohm resistor is blown, it was because the 572B tube
grid shorted out to the filament. The grid resistor disappears with a
shotgun blast noise (happen to me three times). So replace the band
tube and 33 ohm resistor and, more than likely, normal operation will
be restored - good luck Pete (W8UXD)

The 6146 was introduced by RCA in 1951, as a replacement for the 2E26 transmitting tube. It allowed you to crank-up the output of a transmitter (one using a 2E26 of course) without any modifications; you simply remove the 2E26 and plug-in a 6146! The 6146 could be used in the 2 meter (144 MHz) and 220 MHz VHF bands with reduced output. In the '50's and 60's, it was also used as finals in hi-fi audio amps, PA systems, and guitar amps.

The hi-fi version of the 6146, the 6550 (a.k.a. KT88), was later introduced for safety reasons (dangerous plate cap on the 6146) and is quite popular in hi-fi today. The 6550 is also used as a transmitting tube, though not as popular as the 6146. I have seen both 6550's and 6146's in illegally built radio jammers and CB radios.

It may be consistly "searching" for a good ratio. The auto tuner in the radio can only tune effectively if the stand alone antenna SWR is around 2.5:1 or better. Anything above that the tuner will not tune and may become confused from what I've seen. Check the antenna without the tuner, if above 2.5:1 the internal tuner is useless. Also note the radio should give up trying to tune the antenna if it can't find a good ratio. You may have some confusion in the logic, maybe a reset of the rig would clear it, don't know for sure, check the manual on procedure.

Far out!

I've got it fixed (for now, at least), but I'll make a note about this
in the manual. The "bad" resistor was indeed completely gone.

Thanks, Pete.

I would second the Icom W32A suggestion, it is the only one left in production with dual receivers on it and they have just stopped producing it. I just sold a Kenwood TG71A that worked great as well as Two Mint Icom 02ATs and an HTX-202 so I could buy two Icom W32As while we can still get them, a great rig for the price.

No, I don't think they do anything else except sell books, etc. It's not their mission. But then again you already knew that since this was a rhetorical question.

However, they are buying them from the ARRL and I am sure the ARRL is making money. Amazon can sell them cheaper since it is their business and they are very efficient. Everybody makes out on the deal and we all can save $15!

I had a SB200 quite a few years ago(circa 1975) that alos blew one of
the grid resistors. I replaced the resistor and the amp ran fine - there
was no tube damage and the amp had never been over driven. That amp was
used for many more years under some rough conditions. I gave it to my
Dad and he kept it in the toolshed in Florida. Over time I replaced the
HV power supply diodes and the meter multiplier resistors for HV. I
understand the latter is a common problem; probably the original parts
were under-rated. Reading this thread, I wonder if that was also true
of the grid resistors.

John,

If you just want to put all radios on one antenna for receiving purposes, you can get a 'multicoupler'. This takes one antenna input and has multiple outputs to go to receivers. Some come with an amplifier inside which allows you to adjust the output of the multicoupler to make up for losses going through it.

If you just want to put several transmitters on one antenna, you can get a 'combiner'. This is like a multiple section duplexer which allows you to put multiple transmitters on one antenna. The ones I've worked with have had each input tuned to pass a specific frequency or a small range of frequencies around a center freq. These are used at some repeater sites to allow one antenna system to be used by several repeater groups.

The catch is that most of these items that I've seen have been for VHF and above. The lower you get in frequency the larger the components that make them work become, to the point that they eventually get too big for the average ham installation.

If you should come up with a source of items like this for HF that are not terribly large please let me know as I may have an application for one here soon too.

73,

Mark

Unless you have a Peavey Roadmaster guitar amp head, where the factory wired pin #1 as a B+ tie point. I've seen two of them done that way, and on the first one I found out the hard way to the tune of, I think it was 600 vdc across my little finger, cuz the stainless ring around the base of the tube is tied to pin +1 which is supposed to be grounded..

> The 6550 is also used as a transmitting
> tube, though not as popular as the 6146.

Yup, 6146's are used in many of the old tube rigs, including my old Heath SB-101's and now in my Collins KWM-2. Fortunately, I have a few NOS 6146's to last me for a while..

I should add that the 8552 (I think that's the number) was a 6146
with a 12V filament.

5842. HELP-Need Info on Knwd PB-2 Battery

Newsgroup: rec.radio.amateur.equipment

Can someone tell me what the Knwd PB-2 batrtery takes to charge?
Battery says 8.4v
Cant find the charger, hoping I have something around that will work.

Thanks
Mark

One problem that plagued that series was the pc board to chassis ground connections. You may need to clean the chassis where-ever a screw mounts the PC board to provide a return path for the foil ground return. The aluminum oxidizes and intermittent ground connections result.

Hi there!

Is there anyone who can help me to send me a copy of the service manual for the RX Icom R71??

My main interest is the (re)alignment procedure, for my RX is 'off-beat'.

Any help is appreciated!!

Thanks

Kees

Source record: 52101

Hello Kees,
One can find many owner reviews and opinions on several of the
Timewave DSP units at www.eham.net
Just select 'product reviews' from the left side of the homepage then
DSP Units.... I have considered buying the Timewave 599zx but instead
have just ordered the ClearSpeech DSP base unit. According to the eham
reviews on that unit from those that also owned the Timewave DSP the
ClearSpeech unit out-performed every other DSP unit these folks had ever
used including the built-in DSP of rigs like the FT1000MP MK5

FYI here is a direct link to the ClearSpeech DSP product....

Funny, I looked up "ARRL Handbook 2002" and got $34.95 for both the hardcover and softcover editions -- there might be something flaky with Amazon's search engine. The ARRL has it at $49.95 hard, $34.95 soft...

On the other hand, if you search for the "ARRL Antenna Book 2002" you get last year's 19th Edition, paperback, selling for $30, which is what ARRL sells it for, too.

Just for information, you're not 'paying' a premium for FM or CW modes in an amplifier, since they can be run in almost any class of operation for those modes. SSB requires careful and stiff biasing to avoid IMD products.

You might get by with reworking an CB amplifier, although the FCC view is that they are illegal for use even in the licensed amateur service. You will need to provide harmonic filtering for six meters, and most likely need to rework the biasing for linear operation (many CB amps were poorly biased, if at all).

Hmmm, well I ordered the hardcover edition for $34.95 and have the order confirmation at the same price. Looks like they are able to provide a nice discount. Probably because they buy such a large number from the ARRL. Also, they are only charging me $2.98 for shipping. That's also a better deal than the ARRL.

5867. Trade 2m for CB

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-12 04:41:58 UTC
From: ve3tmt <ve3tmt@rac.ca>
Message-ID: <TqIH7.5305$wd1.567125@news20.bellglobal.com>
Source record: 52121

Not a misprint! The 2m mobile hardly gets used so I would like to trade it for a 40 channel AM/SSB radio. This CB will help me out in my travels into Northern Ontario where the 2m repeater coverage is marginal at best. Radio is less than 1 year old, works perfectly (as perfect as Radio Shack equipment is) comes with hand mic and power cord. Not a scratch on the faceplate, although the covers may be scratched due to how is was mounted. If interested I can send you a shot of it mounted in the car. Due to mounting space restrictions in my car, the smaller the radio the better. Let me know what you've got.

Max ve3tmt@rac.ca

Hi all,

I wonder if any of you 570 owners have linked a minidisc player/recorder to aid in giving back audio reports ??? I have tried to attach it to the ACC2 port by using pins 3 & 4 for output to the MD (which works fine) and 11 & 12 for input from the MD. Now it's the output from the MD that seems to be the problem. Not really sure how to make it work. Any ideas ? Will the ACC2 take audio input or is it just for fsk type stuff ?

Thanks for any help

Jonathan

Thanks, everyone! My wife passed the Tech test yesterday (I passed my Extra, too!), and we took the advice here into account. We chose the VX-5R. It's a bit pricey, but matched every single criterion we had, plus some stuff we didn't require, but don't mind having. I've ordered two, and expect her to be on the air the day the FCC puts her name in the database.

Anyone want to buy a mint condition IC-2SRA, no cellular blocking, with the book?

-Crusty

FS: Service MANUALS for Test Equipment:

(For SHIPPING costs and payment options, see notes after manuals list.)

TEKTRONIX:

212 Oscilloscope, Ops and Service: $33

453 Oscilloscope, Ops and Service: $35

475 Oscilloscope, Ops and Service (B10101-B249999): $45

491 Spectrum Analyzer, Ops and Service: $35

1106 Power Supply (PP-7549/U), Ops and Service: $18

1502 Time Domain Reflectometer, Ops and Service: $27

7623A/R7623A Storage Oscilloscopes, Ops and Service: $45

7A22 Vertical Amplifier Plug-In, Ops and Service: $22

7B92A Timebase Plug-in, Ops and Service (set of 2): $35

7L5 Spectrum Analyzer Plug-in, Ops and Service: $35

DC503A Frequency Counter Plug-in, Ops and Service: $22

FG501A Function Generator Plug-in, Ops and Service: $22

PG508 Pulse Generator Plug-in, Ops and Service: $25

TM503 Power Mainframe, Ops and Service: $18

HEWLETT PACKARD / AGILENT (HP):

141T Spectrum Analyzer Display, Ops and Service: $20

400E, 400EL, 400EL02 AC Voltmeter, Ops and Service: $20

(Also for: AN/USM-265, ME-459, and ME-465 military versions of the 400E meters.)

432A Power Meter, Ops and Service: $20

6205B Power Supply, Ops and Service: $16

6255A Power Supply, Ops and Service: $16

8406A Comb. Generator, Ops and Service: $20

8558B Spectrum Analyzer, Ops and Service: $40

8660B Signal Generator, Ops and Service: $35

OTHERS:

AUL SG-1144/U Signal Generator, Ops and Service (set of 2): $18

TV-7 Series Tube Testers, Ops, Tube Data, and Service: $25

(Complete Set of Five Latest Manuals, for TV-7/U, TV-7A/U, TV-7B/U, TV-7D/U)

TV-2 Series Tube Testers, Ops, Tube Data, and Service: $25

(Complete Set of Six Latest Manuals, for TV-2/U, TV-2A/U, TV-2B/U, and TV-2C/U)

ME-22 dB Meter, Ops and Service (set of 3): $10

AN/USM-159A/B Frequency Meter, Ops and Service: $10

OS-262(P)/U OSCILLOSCOPE, Ops and Service: $25

SHIPPING:

The above manuals are all in electronic form, deliverable via email (FREE SHIPPING), or, on a CD ROM disk (includes CD case). Some of the larger ones may not be practical to send via email. The manuals are in Adobe Acrobat 5.0 (PDF file) format. The Adobe Acrobat Reader 5.0 is INCLUDED on the CD. It is also freely-downloadble, for use with emailed manuals, from www.adobe.com.

The free Adobe Acrobat Reader 5.0 software can be used to read, print, search, enlarge/magnify, copy and paste from, etc, the manuals, making them superior, in many ways, to paper versions of manuals. They are also extensively hyper-linked, enabling the user to jump directly to figures and tables, etc, from wherever they are referenced in the text, and to jump directly to any section, figure, page, etc, from the Table of Contents.

Shipping costs for CDs: Within the continental USA, cost for shipping a CD, with CD case, is $2 for 1st Class Mail, or $5 for Priority Mail (2 days). Other locations: email for cost.

PAYMENT:

I accept Visa and MasterCard, but only through the secure PayPal website, at https://www.paypal.com. My paypal ID is tomg@fullnet.com. I also accept checks, money orders, etc. Payee info:

Thomas P. Gootee, 1795 West Schuetter Road, Jasper, IN 47546, USA

QUESTIONS? Email me, at: tomg@fullnet.com.

I am continuously adding more manuals, and good used test equipment, at:

http://www.fullnet.com/u/tomg

Thanks,

Tom

The Acc2 input will accept audio. I believe mine had the input level set to minimum as the default though. Go into the menu and look for the "AF Output" and "AF Input" settings and make sure the input level isn't turned off.

Good luck

Jonathan,

Try this diagram for sound card or your MD player
to radio interfacing (not the isolation transformers)

TS-570 13-pin ACC-2 (double check)
http://www.packetradio.com/00rascal/R-KW13PD.gif

Kenwood in general.
http://www.packetradio.com/psk31.htm#KENWOOD

You may have to change the connectors for proper operation with your
specific minidisk player/recorder. A quick check of the recorder input
impedance (likely low),
may be all that is needed . The proper isolation transformer can achieve a
perfect match..

If you need any information on interfacing try "Buck" Rogers, K4ABT web
site:
http://www.buxcommco.com/

or e-mail "buck" directly !
buck@buxcommco.com

Cheers.

Brad -

The easy answer is to write a letter to president of Yaesu / Vertex
Standard - Japan.

Politely tell them that you will not purchase products manufactured by
a foreign company --- if they are not going to adequately staff and support
their technical service department (as well as parts for their rotors) in
the U.S.

Customer service has to be demanded from the owners, don't beat up on the
U.S.
representatives - they take their orders from overseas (Japan).

Almost 99 percent of the problems with Astron power supplies is the LM-723. Just replace it, and your problem could be solved. It is worth the buck or two for the device to give it a try.

Do both. Letters to corporate presidents might do some good, but they might also be ignored as the products of a crank or crackpot (the difference between the two is subtle, and not important to this discussion 8-)). Letters to the local reps might give them reasons to complain back to HQ, perhaps via channels that might do some good. After all, the US employees would suffer if US sales went down. Warn them that this is possible, suggest ways to avoid it, and maybe they'll boost your ideas to management.

Certainly no down-side to sending two letters, is there?

Crusty

I have a total of 5 units of these main frame sweepers
Kruse Systron Donner RF Sweeper Model 5000A. Working Unit. Features include: Adjustable Horizontal Sweep Speed 0.01 to 10 seconds; Horizontal output, Manual Trigger; Adjustable Start, Stop and three Marker Frequencies; Rear Panel connectors for external Sweep, external trigger, external AM modulation, sweep output, blanking output, marker output, 1KHz output; Selectable 115 or 220 VAC input. Designed to work with Model 5xxx RF Oscillator Plug-Ins. $125 each all 5 for $500 Plus shipping

Kruse Systron Donner RF Oscillator Model 5011. 1 - 2 GHz Working Unit. Features include: RF Attenuator Control; Selectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe $125 plus shipping

Kruse Systron Donner RF Oscillator Model 5014-9. 6 - 8 GHz Working Unit. Features include: RF Attenuator Control; Selectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe. $125 plus shipping

Kruse Systron Donner RF Oscillator Model 5015-2. 7 - 11 GHz Working Unit. Features include: RF Attenuator Control; Selectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe. $125 plus shipping

Total of 1 each of the plug-ins

Pictures available for all above by e-mail

Amazon will sometimes quote different prices to different people or
at a different time of day. If you place the order then, that is
the price you pay. They have admitted to this in the past, it is a
form of market research. At least once, when enough people
squawked, they refunded the difference to everyone that had paid
more than the minimum selling price.

Tom,

I have the Atlas 350 XL--I never heard of the XC. Anyway, *some* of the
Atlas's were prone
to get RF in some of the circuits causing squeals and "squirrilly" audio.
I'm having that trouble with mine right now. There is a gent by the name of
D. .Losty that is pretty good with these things. A working Atlas should
bring $250-$300/

5891. Question about Alinco DX70TH

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-12 23:34:25 UTC
From: amfone@concentric.net
Message-ID: <c76750a5.0111121534.1b4fec59@posting.google.com>
Source record: 52143

I have an Alinco Dx70th..
I want to drive my L4B with it.
Is there a tune position to put
out a signal to tune up the amp ?
Can't find anything in the manual about this..
thanks
tim

Message-ID: <3BF0716F.2E95533A@inebraska.com>
Source record: 52147

I have an Alinco DJ-S41T 440 mhz mini handheld for sale. This is the 300 milliwatt cigarette pack sized rig (not the flimsy credit card sized

one). It works 100%. I regularly use it on a repeater some 5 or 6 miles from here and can hit that repeater solid from up to 20 miles. This is a great radio for simplex use at hamfests or doing work on your towers and antennas. The case is worn from many hours in my pocket, but

nothing wrong with it that affects operation in any way. No accessories, just the radio. For more info on this model, check out: http://world.std.com/~wdr/alinco.html

Asking $50 plus shipping (s/b about $4.00).

Yes, I remember those !

I asked Bill Henry about that ages ago (classmate worked for him while getting EE at Illinois)

HAL used an off the shelf commercial cabinet. The rack ears was an option from mfg for box. Now if you can drop Bill a quick e-mail at HAL at ask him whose boxes did they use ... you might get lucky. I don't think it was LMB, might have been Hammond ?

Source record: 52003

I have a TR-9130 that needs a little help in the display area. I had it worked on but the upper right segment is inoperative across the board. Other than that, it works perfectly in all modes. Power is 25 watts output into a Bird watt meter and dummy load. This Clean unit has never been mobile and includes the rare BO-9 base with memory supply, phone jack, and power/xmit switches. I am asking $250 obo for both units with manual. I can bring it to the Ft. Wayne Hamfest this weekend.

I believe it is, yes. I seem to recall that LMB was part of Bud's "economy" line of enclosures. Good stuff, but not priced near as high as the industrial class goodies.

FWIW: I've had pretty good luck making rack ears with a surplus blank rack panel of the appropriate height, a vise, and a drill press.

Another shack cleaning special!

I have way too many 2M radios and so the Yeasu FT-270RH must go! The radio is about an 8.5 cosmetically. The radio has given flawless service. The LCD is clear. It has the DTMF mic and does ctcss tones. It comes with the radio, mic, power cord, and the mobile mount with quick release.

A few specs for those interested. 2 meter FM mobile radio, 45 watts output. 10 memories, and scan. It does not have the optional tone board.

I would like $95 plus shipping for the radio. If you need a picture, I can take one and upload it to my webspace for your viewing.

I have a 2 meter amp for sale. It is new-in-box as I never got around to using it. It was made for Radio Shack and by all accounts was a good amp and did a superior job of rejecting intermod due to its good receive filter (that's why I bought it). It has all the mounting hardware, etc.

Specs are 1-5 watts in 30 watts out, has receive preamp.

Here's a picture: http://www.eskimo.com/~ghopper/2Mamp.jpg

I'd like $40.00 plus shipping but will consider offers.

Hi,

I just buy this Kenwood TS-820S from one fellow HAM. It was not used last 5 Years. Has very interesting problem HV Meter shows around 900 Volts and blowing fuse on the transmit. I think some one try to increase output power !! How can I re adjust this . It looks like Rig putting 100W (regarding to my MFJ Tuner watt meter !!) is this means that I need to replace output tubes ??

Rick:

I have the entire AT-2500 Manual in PDF format. I also have added to the manual a mod which I have installed on a number of AT-2500's. It requires you to use an EXTERNAL antenna switch, BUT to be able to switch the ATU IN/OUT of a common incoming ANT line, so you can use it on ANY antenna, OR you can take it out of the line when an ATU is not required.

Drop me a note at n0ss@arrl.net if you wish to abtain a copy of the AT-2500 manual in PDF format - FREE.

5914. Writing I-Com IC-2800H software

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-13 14:58:55 UTC
From: jnk@emrinnov.com
Message-ID: <340c9892.0111130658.29fcd511@posting.google.com>
Source record: 52016

Are there any books or sites on writing software for the IC-2800H unit? What are the commands to query or program the unit? Has anyone ever done this before? Thanks.

-Joe Kimbler

I have several sets of pulls (long unused) from local tv station
and several sets of pulls (some unused equipment) from FAA and Air
Force equipment
4cx 250/4cx150

I also have the following radios for sale

Ts 440 SAT all mode HF
TS700SP 10 watt all mode 2 meter
Clegg FM 76 rock bound 220
MFJ 989c Versa Tuner 3KW roller inductor
1296 homebrew kit xverter 2 meter in between 2-5 watts out with 5 in
220 homebrew xverter 6 meter in 5 watts in max 20 watts out
2304 mhz xverter homebrew kit
2304 mhz TWT amp 10 watts out (heavy, shipping costs will be $25)
1296 amplifier 1-5 watts in 400 max out, in a 7 foot rack (LOCAL DFW
only due to weight) needs to be rewired, also runs on 220
2 meter tube amp (4cx2/150) needs rewired has tube supply
no shipping on this amp due to weight dfw area only
2 meter all mode 25 in 170 out transistor 12 volt amp
6 meter 4cx 350(2 tube) amp in a case with power supply
(shipping would be $40) amp has not been turned on in 3 years
power supply was reworked, then lost 6 meter radio

I can be reached via email
km5rt@home.com
or by phone 8175143987 after 3pm CST

Message-ID: <3BF14167.F9E1CADA@ralph.com>
Source record: 52022

I believe you already have the information to charge the pack...
8.4 v / 1.2 v = 7 cells nicad about 700 ma capacity per cell ?
so just charge them at 8.4 and 1/10 of current rating 70 ma.

most wall chargers can do this or add a small voltage regulator
and you are in business.

no harm to charge them slowly using less then 1/10 ma rating
but too much ma can hurt them.

73 ralph jack of all trades-master of none !

Check out the "tuning plug" or some such name, sold for Icom. It is in QST and EBAY. I THINK it is supposed to work on Alinco. I had a DX77T and found info to make the tune function work by using a switches on the rear plug. Otherwise I had to go to CW and Key the rig.

Thanks! The VX-5R's arrived today (got them overnight from Giga-parts, after seeing their link on www.qrz.com). Man, these things are cool! Tiny, light, smart (it's so nice, after years of poking the miniscule buttons on the IC-2SRA, to have the radio infer offset and mode from the frequency), and it's a comfort to know you have 5 watts if you need them.

Only complaint (and it's not a complaint, really) is that the stock antenna is a bit long. We've seen a number of antennas in the third-vendor market. Anyone have one they like with an SMA connector?

>
> --Levent KC2CNY
> Please replay to lsasmazel@home.com

Are you watching the plate current as you tune up? The 900 volts is
normal. Forget that. You shouldn't pull more than about 200-220 MA
when fully loaded. If you try to tune up without looking at plate
current" IP", you may be pulling way too much current, which will blow
the fuse. Is the fuse the correct size?
The output is fairly normal. I can't really say further until I know
what kind of plate current you are pulling. It should NEVER go over
250 for any amount of time. 200-220 is the norm at full output on
those rigs. Your idle current should be 60 ma. Offhand, I'd say the
rig is normal, and you are blowing fuses due to cockpit error. Did you
get a manual? MK

5939. WTB Transmitter for 400-500 kHz band

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-14 03:46:22 UTC
From: Jeffrey Herman <jeffreyh@uhunix4.its.hawaii.edu>
Message-ID: <9sspee$r8o$2@news.hawaii.edu>
Source record: 51923

A group of us applied to the FCC for an experimental license for the 400-500 kHz band; so far so good -- a callsign has even been granted: WC2XSR. Now I need a transmitter to cover that region. Please let me know what you have.

Our ultimate goal is to have a portion of that band turned over to amateurs, so the transmitter you provide may help to achieve this history-making accomplishment!

Hi,
Better be battery backed AC clock then. Power outages do occur.
Your PC has it. You can synch. There is small utility such as
Dimension 4.

Heathkit made one like you describe years ago, but they are no longer in business.I don't know a model number, but you might be able to find one at a hamfest or Ebay.

Thanks for the info. I did start watching IP current when I was transmitting. Here the senerio. At the start IP shows 60 mA. If I do talk too much (It is not a good thing) idle current starts raising and at the end meter hits 350 mA and fuse blows. I did check the service manual (I am not very familiar with the tubes but not bad with the other stuff "SEMI ONES") when the meter switch is switched to IP mode it meajures the voltage on the R2 and R3 10 ohm and 1 W connected serial and connected to the V1 and V2 6146B pin 1 , 4 and 5. My possible senerios;

1. TUBES has some problem
2. R2 and R3 is OPEN Circuit.
3. ???????????

Any other sugestions ....

Thanks again

Levent KC2CNY

Hi,

On some occasions whilst turning the rx on, the rx appears to turn its self off, ie. the lights go out followed by an audible click from the speaker and then turn its self back on again, all while I still have my finger on the on/off switch.

Has anyone else experienced, and/or know what the problem is?

Many Thanks...Vince

I have a Kenwood TH-315, pre-FCC, that means before they to 220-222mzh,
220 h/t for sale. It has 20 memories, DTMF pad, tone encode, battery, wall
charger,
standard antenna and another one that's telescoping to get those signals in
while sitting on
the couch, or out doing simples. Me, while sitting on the couch.

The radio laid around and was hardly used. It looks brand new, almost like
it just came out of the box

Price: $175 obo shipped COD, prepay or Paypal

There is a problem with the atomic clocks. I have two of them and have one set for local time and the other set to read out in 24 hour format. But what I really wanted was to be able to set the clock to Zulu or GMT and you can't do that because it will reset to one of the USA time zones only (setable). If you set it to Zulu time, it resets itself back to local time....

Marvin

All 'junk' LCD clocks, or analog wall clocks.
The analog movements can be had from Klockit for twenty bucks.

AHHH, errr, READ THE ORIGINAL POST....

He is looking for LED readout, not the LCD readouts. He'd like it to be AC powered.

I must admit that the "atomic" clock I have with LCD readout is hard to read and every single "atomic" clock that I've seen advertised or on the shelf is BATTERY powered.

If you have a permanent internet connection, e.g. xDSL or a cable modem,
you can use a program called NTPD to keep your clock in sync with WWV.

Apparently so...and it applies to watches, too.

My current Timex Expedition is a good example, you can get it (or at least could when I bought mine) with a digital compass *or* dual time zones. Apparently Timex figured that a lot of people would want one or the other, but that nobody would ever want both. Really sucks for astronomy or ham, where both can be quite useful, and having them backlit on a watch is a real bonus.

I have a pair of MFJ big face 24 hr analog wall clocks. One
for Zulu and one for Local time. They run on one AA cell for
years and keep surprisingly good accuracy. They stay close
to the minute with yearly corrections. I removed the sweep second hands though, because
they were so noisy they kept
me up at night.

The computer is another story. It loses time in a matter of
days. There is a program called Dimension 4 that automatically
updates your system clock when you go online.

Lessee - 100 V @ 1 W = 10 mA

If it doesn't have to be exactly 100 volts, you could use a 0C3
(octal, 105 volts) or 0B2 (7 pin miniature, 108 volts).

You might check into the Communication Concepts amp component sets like the AN762. You'll need to add a Carrier Operated Relay circuit and low pass filters for the bands of interest but basically, this will give you 5 watts in and from 100 to 180 watts out depending on which model you want.

Bad switch or cold solder joint on the switch connectors. Suggest you get
your soldering iron out and het the switch connections clean off the solder
on the switch and resolder the connections. If this still does not fix it
then find another switch.

Speaking of "no clocks"...

I wonder why the manufacturers of ham gear don't include a clock as a built-in feature? Sure would be a handy thing to have, and I gotta believe it wouldn't cost 'em much to design in. Press a button... the frequency display reads out the time... how hard can that be? On HF rigs, why not include the ability to dial up WWV, CHU, or some other time standard station and sync the clock up to UTC? Cool!

I had a fellow ham pick me up a nice atomic clock from Sam's Club a few months ago, and send it to me.. even though I didn't have access at the time to WWVB, and knew it would be unable to set itself. However, since that time, JJY has added a 60KHz BCD time and frequency service, and now my clock sets itself several times every morning on the hour. :) I like the clock even better than I did when I got it, now that it does it's job.. :) Even has an indoor/outdoor thermometer on it.

The Yaesu FT-530 had a clock and alarm built in. I know because my 530 sits with a broken internal connection to the antenna, a broken BNC on the top and a cracked face plate, but by god, at 5:30-6:30 in the morning it BLARES ITS EXISTANCE TO THE WORLD, awakening me in the most Amateur fashion.

JD

They do. The IC756PRO has a clock (and a timer). The Elecraft K2 has a clock.

The 1N4764 seems to be dropped from the listing in my ON SEMI data book and it stops at 1N4763 (91 V).
I don't have any but if I did you would be welcome to them.
Couple of suggestions though;
1) NTE lists their NTE 5096A as a replacement.

2) Two 1N5262B in series.
The 1N5262B is a 51 V, 500 mW and has the same Izt as the 1N4764.

Maybe either of these are available to you.
Good Luck,
Gary.

> meter hits 350 mA and fuse blows.

Are you retuning the radio first before you are trying this? You need
to "tune" in the IP mode so you can watch the current. You have to
tune in either "tune" or "CW" mode. I recommend the final tuneup in CW
mode to ensure full loading.
By final I mean you start in tune mode to get everything set up, and
then switch to CW to finish. You only have 1/2 screen in tune mode,
and can not tune to full power in the tune mode. This can leave the
rig underloaded if you don't finish it up in CW mode.

I did check the service manual (I am not
> very familiar with the tubes but not bad with the other stuff "SEMI ONES")
> when the meter switch is switched to IP mode it meajures the voltage on the

> 6146B pin 1 , 4 and 5.

What does that mean? Are you reading this out of the manual? The meter
when in IP meter mode reads plate current.
My possible senerios;
>
> 1. TUBES has some problem

Possible, but I doubt it if they do 100w. Also the resting current is
normal.

> 2. R2 and R3 is OPEN Circuit.

I doubt it since the meter reads correctly.

> 3. ???????????

I still say maybe cockpit error in the tuning process until I can get
more info on how you are tuning the rig. When in the CW mode, and
tuned up to full power, is the IP current normal? IE: appx 200-220 ma?
>
> Any other sugestions ....

I have no idea. Have you tried retuning very carefully to ensure a proper tune up? What method are you using to tune the rig? When tuning and you start to add a little bit of drive "CAR", does the meter peg instantly? You need to tune a little at a time, until you are used to the process. Start in the tune mode, and then go to CW for the full power tune/tweaking. Your idle current is normal , which means the metering should be ok. I'm not sure if you are trying this, But you can not tune while in SSB mode. I would use an outboard watt meter if you have one, so you can watch the power out at the same time as you are watching the rigs IP plate current. When you add a bit of drive in the tuning process, you should dip the plate current reading to minimum. When you do this, the power output to the wattmeter should appx peak at the same point the IP current dips to minimum. You dip the plate with the plate control, and adjust the loading with the load control. Start with the load control at about 1/4 the way from the left to make sure the loading isn't too high before you start tuning. If the loading is too high, you will draw too much current no matter what the setting of the plate, and you will see the problem you have. Dunno, I've got a hunch you aren't tuning correctly. MK

P.S I am including a post I sent a couple of years ago about how to tune a kenwood rig. I am reposting it here in case you may be doing it wrong or have questions.

. On the 520 or any kenwood hybrid rig:
1:Put meter to ALC
2:mode to tune
3:set plate to appx position shaded for the band you are on. Set LOAD to
about 1/3 scale.
4:Key rig, add CAR drive to show indication on meter. Adjust DRIVE for peak ALC on meter. Unkey rig.
5:Switch meter to IP
6:key rig again, and tune PLATE for minimum IP current.
7:Switch MODE to CW
8:Key rig, add CAR drive until indication on meter peaks, and tune PLATE
for minimum IP current. If below 200 mils increase load and redip PLATE.
If over 200 mils decrease LOAD control and redip PLATE. With a normal 520 etc, full power will be with appx 200-230 mils depending on the rig
and tubes. If you have a wattmeter you can use it and tune for full output. You will notice if you tune for full output, and then look at then IP current it should be 200-230 mils. This is a good indicator of loading. If you show less than 200, you are not fully loaded . If you show more than 230 or so, you are overloaded. This makes for a real clean signal, but can make your tubes run a little hot. But it is MUCH more desirable to be overloaded than under loaded. Underloading can cause flat topping and interference to people nearby your frequency. The
last 520 I had ran at 200-210 mils fully loaded. My 830 loads to about

220 or so. Nearly the same for all practical purposes. You can also
use
the relative RF METER setting if you need a RF indication of when you
have maximum output if you don't have a watt meter. You will notice
maximum output occurs at the same point in tuning as minimum plate/IP
current. Or at least it should if the tubes are neutralized correctly.
One other thing about hybrid kenwoods, YOU MUST do final tuning in CW
mode in order to fully load the rig. Doing a tuneup only in tune mode
will leave you underloaded as the screen is reduced. This will leave
you
in a good position for the splatter award of the year...g MK

Sounds like the bias is going away over time, or perhaps it's got a
parasitic. If I interpret it correctly, the idle current is rising during
periods of extended key down. Seems the parasitic would be more likely than
"fading bias", although a cracked resistor in the bias supply could be
heating up and changing value. I'd be looking there, if neutralizing it
didn't work.

Just $.02

5987. Academical project idea:Controlling a Kenwood TS50 with a computer...

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-14 23:22:46 UTC
From: Valentin <radiotito@yahoo.com>
Message-ID: <3BF2FCC6.96DA6F68@yahoo.com>
Source record: 51987
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Hello all people. I have an academical project idea. I have a Kenwood TS50 (not TS50S). I woule like to make an application to control my TS50. In my TS50 manual appears little info about the unit IF-10D (with a 6-pin connector). I have no idea how could later I connect the IF-10D to the computer. I think that I should connect to a RS-232 computer port, and perhaps also I need the IF-232...
Also I would like to connect my TS50 to a computer running a server (eg. in Linux OS), and a RealAudio server to broadcast to Internet "real time audio" from the TS50. Then I would like also to develope a Java "applet" to put on a web page on Internet, with the appearance of the TS50 front-end.Then the user should be able to change freq., mode (am/fm/usb/lsb/cw),memories,etc...And of course the operation should be taken on the TS50.
I have a lot of questions:
- What I need to connect the TS50 to a PC? I think IF-10D, but...anything more?
- Once I have connected the TS50 to the PC, I think I could send data from the serial port of the PC to the TS50, but...what data must I send to perform each of the different controls? I think there should be any reference from Kenwood...Any info about this?

> output isn't linearr with class AB1.

Sure, whatever you put into it , it will amplify. But I have to say, I
wouldn't want to go that route just to get a 100w rig. Just doesn't
really make sense to buy an outboard amp, when you can spend a little
more and get 100w built into the radio. IE: ft-100 in yaesu's case. Is
there some reason you want the 817 in particular? Such as portable low
power draw? Only if that were a major concern for portable use would I
go that route. At home, this won't be a concern. I'd rather get a 100w
rig any day for my purposes. "home and car/portable use". I'm not
overly concerned about low power draw as I run 100w portable anyway,
and have the battery power to handle it.
>
> Any suggestions ... or experiences with the FT-817 as one's only HF
> radio (base/mobile/portable) would be much appreciated.

I went with the Icom IC-706mk2G "100w" for this purpose myself . It's
the marketing equal to yaesu's ft-100. I've gone the low power exciter
and amp deal before. "yaesu ft-7 and a sb-200". I'll never do it
again. It's a PIA overall as you will end up running 100w all the time
anyway probably. Might as well get it built in the rig. Not to mention
the potential purity problems in many of the low end amps. The 811a
amp would be ok in this case though. But, you spend more for it than
the extra $$$ for the 100w radio. Like I said, to me , it doesn't make

sense. ONLY if I had to have low power draw for portable use would I buy a 817. And if you buy the 817 and the 811 amp, you still can't ever drive the amp to full power without an amp to drive the amp. Sillyness....I buy a 100w radio and dial it down to qrp if I want to run qrp. It's not very often. MK

Mark ,

Thanks for the info. I do NOT think I am doing anything wrong on the tune. These events are not happening immediately. It is taking some time if I turn the rig right now it will take 15 to 20 minutes to hit this point. I am not exactly following your tune procedures but I am following all the tuning instructions from owners manual. I am going to follow you tune instructions tonight, I hope you are right my gut feeling is there is a bad component somewhere.

Running Time Meter, Measures Hours - Ebay

This running time meter reads in hours and tenths of hours. Timer scale is 10,000 hours, and currently reads 0.2 hours. This meter runs on 115 volts. It was made by Industrial Timer, Model C-25, and it is still in production. If interested, I'll send you the manufacturer's PDF file that describes the meter's specifications. It is in very good condition.

For auction on Ebay, click on:

Rotary Inductor - Ebay

This inductor has 20 turns, and a coil diameter of 3 &#65533; inches. The overall length, including brackets and shaft is 9 &#65533; inches. Overall width is about 4 inches, and height is 4 3/8 inches. It is very well made with smooth action, and a well designed contact mechanism.

For auction on Ebay, click on:

I would imagine that LED clocks that work on AC would be more expensive to make than LCD ones these days. You've got a transformer to provide, decent power supply, the expense of UL listing, etc.
Might also be a problem with power line noise coming in and wiping out the WWVB signal; I'm amazed that the LCD ones can pick it up at all, even mounted anywhere near AC powered equipment.

You can still get LED clocks for $10 or so at the local drug store, but I've never seen an "atomic" one.

I like the LCD ones. I have an atomic one with a huge display that's solar powered. I just hung it on the wall and never touched it again!

Mark,

Again tnx for the info I did follow your instructions five times. After the
tune I did keep rig on the dummy load and press the SEND key no MIKE. Here
the results (THERE IS NO AUDIO AT ALL)
MIC/CAR on the 9 o'clock pozition
MODE USB
PTT started 21:45 IP Shows 60 mA
@ 21:48 IP Shows 100 mA (Still NO audio input to the rig)

Wait for cooldown 5 minutes; (Same conditions no mike)
PTT started 21:55 IP Shows 60 mA
@ 21:58 IP Show 100 mA

Wait for 5 minutes
MODE LSB
PTT started 22:10 IP Shows 60 mA
@ 22:13 IP Shows 100 mA

Any idea ....Thanks in advance

Levent - KC2CNY

PS: If any one like to send direct e-mail please delete _NOSPAM from my
e-mail address.

Good evening, Mark.

Well, that may not be entirely accurate. If you have, for example, a class C amplifier that requires 100 watts of drive to give you 1000 watts out, what do you think you'll get if you drive it with 5 watts? You won't get 50 watts. You'll probably get zero.

Of course class C amplifiers aren't linear, but then again, strictly speaking neither are class AB1 amps. So it's entirely logical to expect that if 50 watts in gives you 600 watts out, 5 watts in won't necessarily give you 60 watts out; it might give you 30 or 40 watts out.

Sure, I want to use it for portable use and yet be able to run an amp when the extra power is needed.

This will most often be used in my motorhome, out in the boonies with no hookups. If I'm 40 over 9 at the other end at 100 watts, why not crank her down to 5 watts and save the battery and/or the generator? The ability to also use it on its own internal battery pack is a bonus feature that I will use fairly often.

I already have an IC-735 which is my main home QTH rig. It works great but sucks down the 12V power like you read about, even on receive.

The Heath clock is model GC-1000. Mine has been inop. for years because
I dropped the receiver board and ripped off three cans. I missed that
reliable old clock so much that I designed one of my own around a
Motorola MC68705 microcontroller. Lightning strike took out the
receiver. Now I have three commercial "atomic" clocks that have LCD
displays. Can't read them from across the room!

Sounds like the coupling capacitor between the driver stage and the final stage could be leaky as well, with the longer current flows through it, the leakier it gets. This would allow the grid to go more positive and allow more current to flow.

Yep, that could be the case. I may be misunderstanding his problem. If the idle current creeps up gradually as you talk, and goes back down to normal after you quit talking and the tube cools, this is almost always bad tubes. But usually, it would take a whole lot of talking in order to hit 350 mils, and blow a fuse.
But I've had this happen before with real bad 6146's. Once on a 3 tube final viking valiant I had. It could be a resister heating up, and I would take a look at them to see if any show signs of overheating. I'd be curious to know how long it takes to cool back down and show normal idle current again. It doesn't really take too long for a tube to cool down. The amount of time in the receive mode in a QSO is usually enough. I was thinking he had it out of tune and was blowing fuses. If thats not the problem, I would check the resisters in those circuits, and maybe try a different set of 6146's. I've had the gradual current creep many times on tube rigs. In fact, thats usually the first sign the tubes are going flat. It shows more on CW than SSB usually. If it's a parasitic, it will be fairly instant current peg I would think. No creep about it. Tubes and resisters will creep up gradually. Resisters maybe less gradually. Being he starts out ok at 60 mils, I'd be looking at tubes and and signs of overheating first. I doubt a parasitic is the problem. Tubes are a quick easy swap to see if thats the problem. Neutralizing keeps the point of max output at the point of minimum plate current when tuning. Usually that shows up the most on the higher bands if it's off a bit. Usually wouldn't cause his problem unless the tubes are bad. If the problem he has is as you describe, I bet he's got a bad tube just as a gut hunch. MK

Yep, you have bad finals I'm about 98% sure. I misunderstood the
problem. I've had that happen many times on tube rigs. I'm fairly sure
if you change the finals "6146's" you won't have any more problems.
But I wouldn't wait long. If you keep overheating the rig, you could
fry some resisters eventually. My 830 does that to a slight degree,
but not near the level yours is. My tubes aren't that great...I have
to hammer cw for a while before my idle current creeps up, and it's
only a small amount. It will get worse with time...BTW, you might as
well get a new driver while you are at it. "12by7" Yours is ok I'm
sure, but a preventative measure... if the finals are shot, the driver
has probably seen better days also. Up to you I guess. MK

Nah, the baseball bat doesn't do any more damage- I just used the
radio too much, more like abused it. $100 to send it back to Yaesu and
I'm too cheap to do it. Got a new TH6 so don't worry about it
anymore...

-a 6-pin connector). I have no idea how could later I connect the IF-10D
-to the computer. I think that I should connect to a RS-232 computer
-port, and perhaps also I need the IF-232...

Yep, the IF-10D (which is just a box containing a 7404 hex inverter and some pullups) connects to an IF-232C which has a 25 pin serial connector for the PC. There are plans for the IF232C in the ARRL handbook - I just opened one and it looks like standard old 1488/1489 drivers with an opto and a 555, probably to generate -12V. I'd use a MAX-232 these days.

The data format is included in the IF-10D manual.

I'd never use a class C amp though. Too dirty.
>
> Of course class C amplifiers aren't linear, but then again, strictly
> speaking neither are class AB1 amps.

They are pretty linear as far as our uses. The input vs output's are
fairly linear also, otherwise they wouldn't be able to be called
linears..:(My henry is about 12 to 1 or so, pretty much no matter
what the input level. I've tested this to check it out. If I put in
10w, I get about 120 out. If I put in 100w I get about 1200w. Maybe a
bit more, but it's fairly linear overall. I have to consider meter
error also. My old SB-200 was about the same, although it's only a
600w amp.

So it's entirely logical to
> expect that if 50 watts in gives you 600 watts out, 5 watts in won't
> necessarily give you 60 watts out; it might give you 30 or 40 watts
> out.

The 811a amps will usually take nearly 80-100w for full drive. So you
can count on needing 80-100w to do the 600w out. 80 w to 600w would be
about a 7.5 to 1 ratio. So you could count on getting about 35-37
watts with 5 watts drive on one of those amps if those were the power
levels. You shouldn't be able to get 100w out with only 5 watts. You
would probably need about 15w or so to get 100w.
35 w is enough to talk on fairly well. Usually anyway...

Ok, got you. If it's for mainly portable, I can see it. The 735 is a good house rig for HF. My 706 draws 1.5 to 2 amps just on receive. So it's not really made for low current draw at all. I use big batteries when portable. I charge the batteries from the car when needed, or use a charger if at a hookup. I almost always run a full 100w portable/mobile as I'm on 80/40 most of the time. While I haven't bought one to check it out, for about $12 Canadian, I've seen LCD clocks, with calendars, that by a press of a button, gives you the time in a number of time zones around the world. I forget how large the readout is (and I am assuming they give readout in 24hour time), but it's small enough (and cordless enough) that one can place it in easy range.

It doesn't give 24hour time, but I got for about five dollars a nice LCD clock, battery operated, The digits are 3/4" high and quite readable. When the original battery died, I soldered in an external single-AA battery holder, and methinks the battery will last practically forever.

Your point about LED clocks still being available is good. Even if you couldn't buy them new, there must be plenty at garage sales and places like the Salvation Army. Most of them, however, don't give 24hour readout. On the other hand, a lot of them must use ICs that can be set to that format. Especially with older clocks, where the IC will be well defined (as opposed to a blob of epoxy with leads coming out of it), one might be able to find the data sheet, and then set the jumper(s) for 24hour readout.

As for long term accuracy, I think what we are seeing is a move away from line-based counting, which overall tended to stay within reason, to crystal based timebases, where the errors just add up. With these clocks costing so little, there won't be much effort put in setting the time base accurately in the first place. Indeed,

some cheap LCD clocks/watches I've seen don't even have a trimmer
for adjusting the crystal frequency. So, oddly, those clocks that
reset to WWVB may not be due to a need for "super-accuracy" but to
compensate for cheap clocks. In effect, they are a modern day
way to return to the days when clocks got their timing from the
AC line; they might speed up at times, but then they'd slow down
at other times, and thus rarely ran slow or fast over the long term.

So the solution might be to buy an LED clock at a garage sale,
set the jumpers, and then run it off a homebrew crystal time base,
one that could be set accurately to WWV. Use the same time base
as a frequency standard.

Just like in the old days.

Hi there,

I've got a really sweet condition Kenwood TS-830 for sale. I started off with the entire station, sold off all the accessories because I wanted to keep the radio to use and sell off my TS-530.

Turns out the friend using my loaner 530 doesn't want to try the 830, so I'm now going to place the 830 up for sale.

I bought this radio from a good friend who retired and sold out everything to try a travel life in his motorhome. I'd be willing to bet there is less than 25 hours use on this radio, at least half of it my listening to the swap net over his house. I've got it at my house and it plays real well, you can work me on 40 meters if you'd like to hear it.

So here's the bottom line... I'm near Sacramento, the price is $400 or best offer. You can see these radios go for mucho more on Ebay, I doubt if you'll find one as nice as this . Many of you know the 830 has one of the best DX recievers made. As far as I know... everything is working (even the meter light) and it has normal output.

It's a really well playing tranceiver... yes it does have the warc bands and a digital display. I'm sure pictures of it are on the web, just hunt on ebay have a little sticker shock.

If you want to ask me questions, feel free to drop me a note, you have to take the NOSPAMPLEASE out of my email address above, or cut and paste the one below. If no one wants it, I'll pop it up on Ebay. Life is easy right..? I've got all positive ebay feedback near 300 for references and lots of local ham friends who will confirm I am a trouble maker laying low.

Thanks for reading this... I can ship it anywhere if your willing to pay the costs... I'll deliver local if practical and drink any $17 bottle Cabernet wines you have around. Forget the hard stuff, I don't like the hang overs anymore.

thanks mucho
cheers
skipp

That's great news, Brenda! Glad it worked out as well as it did. Mine only sets itself at around 1AM, and it often misses a couple of days a month.

By the way, Sam's Club has some other models now, indoor temp only, but it does have a "moon phase" indicator. Since the time code doesn't include moon info, my guess is that you have to set that feature manually and then it tracks the moon's 28+ day orbital period.

I am not personally familiar with the 350 XL, however, I do have a
Atlas 210 X, which is a little smaller. I have had nothing but fun and
greqat contacts with the thing. I have used it mobile for years with a
Texas Bugcatcher and it has performed fantastic. IT is a simple rig
with very few bells and whistles, and is about all the radio I would
want to try to operate while driving down the road.

It also had an option for a crystal box to make it go out of band for
MARS, CAP etc. It was fixed tuned on the crystal controlled channels.

Hello. I recently purchased an MFJ-9406 and will be getting a 10w in 150w out amplifier for it. In the manual for the 9406, it talks about the RCA jack on the back of the radio in relation to an amp. The amp I am getting (Mirage 1015) has an RCA jack also on the back. What is the purpose of connecting these together this way? Does Radio Shack sell a pre-made cable that I can use here? Is it REQUIRED to run the amp?

Usually, this applies to dual band Ht's. IE: ft-470 . It can act as a
repeater with no mods, except for keyboard entry setup. MK

6037. FS: Complete 2m/440 setup!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-16 05:13:43 UTC
From: vhfradiobuff@aol.comspamsux
Message-ID: <20011116001343.11000.00000142@mb-cn.aol.com>
Source record: 51941

Selling the following complete 2m/440mhz setup for $325 firm (would cost $370 for the items individually at my prices, a lot more at new prices), or willing to sell individually at the listed prices. I am getting rid of this stuff because I don't have much use for 440 and want to buy some other items.

Kenwood TM-G707A 2m/70cm dualband radio. This radio is still sold by Kenwood with an MSRP of $329.99. Include original box, manual, microphone, power cord, mounting bracket and hardware and microphone clip. The radio is in very good condition, never mobile, non-smoking environment. See Kenwood's website (http://www.kenwood.net/ama_categories.cfm) for complete specs. Asking $255.

Astron RS-10A power supply. In very good shape, works flawlessly and powers the Kenwood at a full 50 watts with no problem. See Astron's website for specs (http://www.astroncorp.com/dcdc.html). Asking $30.

MFJ-844 2m/70cm dualband watt/SWR meter. Has 15/60/200 watt settings. Works very well in excellent shape. See MFJ's website (http://www.mfjenterprises.com/products.php?prodid=MFJ-844) for details. Asking $45.

Cushcraft Ringo 2 meter (AR-2) and 70 cm (AR-450) verticals. The 2 meter antenna is used, but in fair condition and works well. The 70 cm antenna is very new, only a couple months old and has seen very little use. It has the original box and instructions. Asking $20 for each antenna.

Please reply directly. Shipping is extra. Email me with your zip code and I will come up with a shipping cost. These items would have to be shipping in several boxes.

I'm not familiar with the 9406 or the 1015, but I suspect what you have is an external keying relay for the amp. As to whether you need this or not, it would depend on the amp. If the amp also has RF keying, then you don't need the external keying relay. However, it does come in handy for SSB and CW work. It sounds as if all you need to hook the two together is a RCA-m/RCA-m cable, which is readily available at Radio Shack. See what your manual with the amp says.

>http://vhfradiobuff.tripod.com

The direct connection allows for the amp to be 'turned on' (applies a
bias voltage to the amplification circuitry) by keying the 9406,
otherwise there is an RF sensing circuit that activates a relay. In
some cases, if the RF drive is very low the sensing circuit does not
activate the relay, or the relay 'chatters' with the amplifier stage
cutting in and out.

Ratshack does sell RCA<=>RCA cables. This scheme is not required to
use the amp, try it without first as you may have success. I have a
9406 and find it puts out in the area of 4-6 watts and that should
trip the RF sensing circuit (usually referred to as a T/R or
transmit/recieve relay). If not, the cable should only cost a couple
of bucks.

The only thing you will truly need to fully enjoy your setup is a
cooperative E-layer 8-} We are coming into the time of year when some
Sporadic E propogation is expected (hey, if it typically occurs is it
really sporadic??) so when you're around the house keep your rig
turned on and you may get a welcome surprise. You may even reach us
folks here on the left coast - I've logged FM19 which is the grid to
your immediate west.

73,
Howard KE6MAK

So, then if I used that, would a jumper be required from the radio to the amp, then from the amp to my tuner/meter?

>The only thing you will truly need to fully enjoy your setup is a
>cooperative E-layer

A little off topic :) but we had some good conditions a few days ago, only managed 2 contacts with the 10w the 9406 puts out, but contacted a station in WA state (CN87) and Vancoover Island (CN88). Later that day I heard Alaska and then the next day, I was RXing Scottland. That is why I decided to get the amp, to increase my chance of getting a contact with the radio and the 3 element yagi.

From: Bob Balonis <rmborcmb@penn.com>
Message-ID: <cz7J7.1372$m_4.90671@nntp2.onemain.com>
Source record: 51857

Hi all, Can anyone give a correct interpretation of the Maximum Input Voltage specification on my 465M scope?

Spec states @100MHz, Max In Voltage = +/-5V DC plus peak AC @100MHz (when either AC or DC coupled). Assuming a 1x probe,

Is the correct interpretation that when trace is centered and with the scope minimum sensitivity of 5 v per division (8 vertical divisions on screen display), that the maximum RF signal level is 40 volts Peak to Peak (50 volts Pk to Pk if +/-5 V DC offset included?)?

An alternate interpretation is that if trace is centered on the bottom of the screen, and again with the minimum 5 v/div sensitivity, & 8 div vert display capability, then the maximum specification voltage would be 40 v Peak (or 80 v Peak to Peak).

Either of these interpretations correct?

Thanks to all in advance, Bob

"Spec states @100MHz, Max In Voltage = +/-5V DC plus peak AC @100MHz
(when either AC or DC coupled). Assuming a 1x probe,"

Max In Voltage = +/-5V DC plus peak AC @100MHz - is that per division
or total signal into a 50 ohm termination?

Even though there are only 8 divisions on the graticule, check the
manual. I think you'll discover that the input is over 10 divisions
giving some headroom for overloading. The key is taking into account
the entire waveform that is being presented to the front end, not
just what is being displayed.

In your first example, 40 volts pk-to-pk fills the entire display. If
trace is centered, thats it. If it took DC offset to center it, it
won't add to the pk-to-pk of what is displayed.

In your second example, I believe its still 40 volts pk-to-pk.

The key detail is whether the scope is displaying the entire
waveform or just a portion.

OK.

I like to share the fix with you folks I did change the finals 2 6146Bs and
TS-820S working like a charm. Thanks for all helping me out from this
dilema.

--Levent KC2CNY w TS-820S

Superb condition TL-922A with twin 3-500Z Eimacs
for 160 - 10 meter coverage (10 meter modification
has not been made but docs included for easy
change) with manual. Just $850.00 plus shipping to
USA licensed ham only. Picture available on request.

Not used for contesting - runs like new.

Will split driving distance for no shipping costs
to any of 6 NE States.

Heading for eBay 11/22/01

Contact John/WD1V
Manchester, NH
wd1v@amsat.org

Hi Jim

I have had both so I'll give you my opinions. The VR-500 is a pretty cool looking radio, it has tons of features its pretty durable, the receive end I think leaves a little to be desired in the upper frequencies 800 MHz on up, I'm not sure if that's because I live in intermod hell or not or the antenna I used which was the stock antenna.. The battery life on the VR-500 is awesome, the bandscope feature is pretty cool also if you're into that type of thing like I am. The Scan speeds on the VR-500 is great too. Overall using the VR-500 for the type of scanning I do, Id give it a 7 out of a scale of 1-10. The R10 is a nice radio and is my first ICOM product, the R10 is about the size of one and a half VR-500s on top of each other, I find overall the R10 is a good general coverage scanner, it covers all the frequencies pretty good out the box, some say the scan speed on the R10 is a bit too slow for them but I like it. Some of the features I like on the R10 are the AMWS which lets you program a range of frequencies, then you can scan that range when you get a hit in the frequency range it stores it in a special bank, you have ten of these to play with. The Easy bank feature is cool also, its like the AMWS but it doesn't store frequencies that get hits, you have ten of those also to program. You have 1000 memory's to use broken down into ABCDEFGHIJKLMNOPQR 100 memories for banks Q & R. Bank Q is for the AMWS search function and bank R is for frequency lock outs, i.e. Paging Channels, Data Comms, etc. On a scale of 1-10 id give the R10 a 9, the reason I wouldn't give it a 10 is because of the battery life using standard AA's other wise its a great radio. If you have any othe questions please post them and Ill let you if I can help.

Good Luck

John

There is, but that is limited considerably. The proposed experimental work goes way beyond the 190khz band potential. IFF it could be put to practical amateur use, that might be beneficial to hams in the years ahead. Time will tell. First the experimental license, then the experimental work, then..... the potential is only good.

ZUT OM DE NA4G/Bob UP

Several weeks ago I posted a thread asking for input on where to get my Kenwood TS930 repaired. I would like to thank all of you who responded with helpfull information. We finally decided to ship the radio to Greg Johnson, K3EWZ, in Malvern PA. We did this for two reasons. First and foremost Greg has excellent credentials. Second was logistical, heavy radio (times) short shipping distance (we live in NY state) = less oppourtunity for shipping damage. Well our radio was returned to us yesterday and I'm happy to say that it looks and plays as new. Greg kept us informed via email during the repairs, upon shipping and billing, which by the way was quite reasonable. I and the XYL would like to reccomend Greg to anyone who is looking for a responsible, honest repair person. As I understand it, Greg has a rather substainstal supply of parts for the Kenwood 930 and 940 series radios. Once again thanks to all or our fellow hams for their input. Ralph , WA2NTK and Kristi, W2NTK...73

I have for sale an absolutely mint Kenwood TS-850SAT. I am the original non smoking owner. I have both shipping boxes, hand mic, owners manuals and unopened accessory bag. The radio is a 10 out of a 10 functionally and cosmetically. The radio includes the SO-2 TCXO unit which is a $180.00 option. This is one of the last 850's manufactured. The serial number is 80200024. This is most likely one of the finest 850's you will find. I am asking $950.00 shipped ground UPS CONUS.

I have for sale an Icom IC-471H all mode 432MHz rig. This radio is in excellent condition and has had the cap replacement mod. I have the original box, original owners manual, a copy of the owners manual, sales brochure, hand mic and power cord. This is the high power version. The radio comes from a non smoking environment.
I am asking $475.00 shipped ground UPS CONUS.

6071. Question on MFJ 945 E tuner (?)

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-17 00:17:39 UTC
From: qrp5@my-deja.com
Message-ID: <cce22972.0111161617.2e640d64@posting.google.com>
Source record: 51875

In keeping with emergency preparedness since 9/11, I mounted a Ten Tec Scout inside an old oscilloscope cabinet, along with a power supply, a set of meters, an AC / DC switch and an MFJ 945 E tuner. After everything was assembled, I carried the portable HF unit outside and connected it to a 12 volt battery and an antenna. It was only then that I discovered that the tuner was not operating. The Scout’s SWR meter indicated a serious mismatch and no amount of twiddling the knobs of the tuner had any effect on it.
The next step was to disassemble the unit and begin experimenting with the radio, tuner and a 249 antenna analyzer. Sure enough, the tuner was inoperative. At random, I pressed a switch on the tuner marked “TUNE / BPS” and suddenly, the tuner began working! I went back to the MFJ operator’s manual and there was no mention of this switch or it’s function.
Does anyone know what the TUNE / BPS switch is for? What does BPS stand for? (I thought perhaps “B PLUS SIDE” or “BAUD PER SECOND”) I have determined that the “TUNE” position of this switch enables the normal operation of the 945 E tuner, while the “BPS” position disables the tuner completely. Might I assume the antenna and transceiver are connected, without inserting the tuner, while this switch is in the “BPS” position, or is the tuner just disabled, leaving the antenna and transceiver uncoupled? It seems incredible that MFJ would totally ignore this switch in their instruction manual. Maybe one of you MFJ owners can share some of your experience with me here? Thanks. Johnny Angel W4XKE@arrl.net

Satellite station....2meter/440 rig, all modes SSB, CW, FM.

Here are the specs and photos....
www.qsl.net/sm7vhs/radio/yaesu/ft736r/ft736r.htm

It's a great rig ....9 out of 10. With the tone unit, manual and hand mike. This is a super satellite station! It is not a compromise between HF and V/UHF. It was designed for satellite operation.

Price $735 shipped Conus....Contact: n2tu@optonline.net

6081. Need Help on Heathkit SB220 Amp

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-17 03:03:46 UTC
From: Charles Hugg <chashugg@earthlink.net>
Message-ID: <mskJ7.47223$hZ.4494555@newsread2.prod.itd.earthlink.net>
Source record: 51885

I have a very nice, almost new looking, Heathkit SB-220 HF amplifier that needs some attention.
When I turned it on, it made a loud arching noise and flashed and fried R3, the .82 Ohm Shunt Resistor in the Grid Current Metering circuit. I have replaced the Resistor, but am afraid to fire it up because I am not sure what caused the problem in the first place. I have a spare set of 3-500Zs so could replace the tubes in case one of them has gone bad. Does anyone have any ideas on what might be the problem. Could R3 have just gone bad on its own? Also, are there and Reflectors or Newsgroups on HF Amps?
Thanks,
Charlie Hugg, K5MBX

I'd take a stab that BPS stand for ByPass, and takes the workings of the
tuner out of the antenna system.

For sale: This is the general coverage version of another ham band only receiver. This
radio covers broadcast band through 33.5 Mhz in 4 bands. It has a main tuning dial
and a band spread dial. The radio is electrically very good, and all functions work. It
has 7 tubes. Physically there are no dents, but there are scratches on the top of the
case and on the bottom lip of the case below the knobs (in the light gray areas). The
front of the radio (dark gray area) has no scratches, and the dial glass is in excellent
condition with no cracks. You will note in the picture below a close up of a 3/8 inch
hole that has been drilled in the rear left corner of the top of the case. Why is the hole
there? There is an adjustment screw below the hole on top of the chassis.

MFJ has a code practice oscillator with key attached for about $25. HRO (Ham Radio Outlet) has them on the shelf here in San Diego.

I tried to find a cheap key (Ameco type) for my nephew several months ago and could not locate any. I bought the MFJ oscillator for him and built a couple of keys from printed circuit board for his friends to use.

6094. Panasonic RF-2200 backlash

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-17 06:30:23 UTC
From: Bob Laird <xlaird@earthlink.net>
Message-ID: <3BF60447.A1517F22@earthlink.net>
Source record: 51798

I just bought a Panasonic RF-2200 that is beautiful in all regards, except for a large amount of tuning backlash, on the order of 10 or 12 KHz, both in the 'fast' and 'slow' tuning modes. The radio does not appear to have been used a lot, and the tuning gear mechanism has a fairly good, tight, smooth feel to it, otherwise.

Does anyone know if there's an adjustment?

6095. Best tubes to buy at a live auction

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-17 06:43:55 UTC
From: googlyelmo@earthlink.net
Message-ID: <3BF60733.461189D@earthlink.net>
Source record: 51799

I am going to an auction this weekend, a local "Americana"/Tchotke store
that is going out of business, and have the
opportunity to bid on numerous lots of tubes (perhaps 50 lots, from
50-200 tubes per lot). I am new to working with tubes, so
my question is this: which tubes should bid on?

I had a look over the lots, and much of it is grouped by tube function
(e.g. regulators, rectifiers, octal triodes, etc.) but not
more specifcally than that (except in a few cases where 7/9 pin minis
are grouped, and to some degree by type designator).
There weren't any really old or rare tubes in evidence at the auction
preview; mostly everything from post-WWII. I am not
going to bid on any high value tubes, especially since I cant test them
ahead of time. I just want to get a start, cheaply and
wisely I hope, at building up a stockpile of tubes to build with (and to
a lesser extent keep my few boatanchors running, though
I know what I need there).

So, please suggest the 10-20 most desireable tubes for all around
building with tubes. If you like, and are willing to put in the
time, you could tell me also which types of various functions/pin
count/era/etc. you think are most useful. Some indication of
value would help me too, but mostly I need to know what to focus on at
the auction. And oh yes, I am going to pick up some
transformers too. Any suggestions on a voltages/current ratings to go
with the tubes? I know this is short notice, but thank you
very much for the advice.

Janice/Ed

The biggest difference of note is: size.

The -5 was designed to match the case size of the FT-1000 series radio.
The -6 was designed to match the case size of the FT-990 series radio.
As such, it it slightly smaller in all dimensions (I think 'all' is
correct, but I am sure it is a bit shorter in height anyway, and I'm
pretty sure it's a bit narrower across the front)

Other than that they are basically the same - you might get a 6" speaker
in the -5 ; the -6 on my desk has a 4" speaker if that's important to
you.

73,

Mark

Source record: 51807

Thanks for the reply. I also thought it might be a bypass circuit, but it seems to disconnect the antenna entirely. For example, with an antenna that resonates at 7.25, my analyzer indicates a 1:1 match for that frequency, which goes upward, both above and below this nominal frequency.
When I connect the tuner to the antenna and select "BPS" the SWR is completely off the scale and it will not "come in" at any frequency. This would indicate that the antenna is completely disconnected by the "BPS" switch.
If I just pick up my antenna analyzer and try to tune to a frequency with no antenna attached, it responds in the same way... the needle is off the scale at all frequencies. If your tuner does indeed BYPASS, connecting the transceiver and antenna, then I'm thinking there must be a failure in my tuner. (?) (I bought it at a hamfest... HI HI) Thanks for all, Johnny W4XKE

Hi there!

Is there anyone who can help me to send me a copy of the service manual for the RX Icom R71??

My main interest is the (re)alignment procedure, for my RX is 'off-beat'.

Any help is appreciated!!

Thanks

Kees

The switch is used to bypass the tuner portion of the
945E. When in the bypass position, the wattmeter is
still operational. During mobile operation, the bypass
position alway me to tune my screwdriver antenna (just
run the motor control until the reflected power dips on
the wattmeter). My previous 945D model did not have
such a switch and the tuner was always in-the-line.

> large amount of tuning backlash, on the order of 10 or 12
>KHz,

A common method for controling backlash in mechanical tuning mechanisms involves sandwiched tuning gears, tied together with springs. When you tune, the gears position in such a way as to allow movement freely, but when you stop, the springs cause the gears to pull and bind. So I would first check for missing or hanging springs in the tuning gears.

I'd just go with a small Sony, Sangean or Grundig portable...
no need for ssb in my opinion. I would be willing to bet big broadcasters like Voice of America, BBC, Radio Netherlands, Deutsche Welle etc. would be the main sources for news for your gf, they're pure AM and easy to catch with a basic shortwave radio due to their high signal strength, Although a wind-up type longwire antenna might be an option worth considering to boost performance when signals are weak.

Something like a simple Sony SW22 analogue portable(if they're still available, they're nice and small, about the size of a cigarette packet) is easy to use, has low battery drain and a pair of AA's last for ages.

A solar charger and a few pairs (just incase it's real cloudy for a while) of NiMH AA rechargables would be an ideal way to overcome the difficulty of obtaining batteries.

Best of luck with your choice.
Paul.

Cross-posted to:
rec.radio.amateur.boatanchors,rec.radio.swap,rec.ham-radio.swap,rec.radio.commercial-lmr,rec.radio.amateur.equipment

FS: New in Box - one pair EIMAC 8874 / 3CX400A7 tubes. These were sold by Motorola to be used in some of their two-way radio/repeater stations, such as the 250-Watt Output UHF MICOR series radios, so Motorola put a part number sticker on the box (Motorola part # 97-10886A01), but inside are brand-new EIMAC 8874's with the EIMAC info and installation sheets. I was keeping these for my Alpha 76 HF Linear Amplifier, but now I've sold the 76 and purchased an Alpha 87A which uses 3CX800A7 tubes instead, so I don't plan to use these new 8874's. New ones from one of the major RF Tube dealers that advertises in the Ham Magazines are $459.950/each, plus shipping. I'll sell this new pair for $595.00 shipped and insured.

6133. Ham/Computer Gear for Trade

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-18 14:06:34 UTC
From: ah6ob@arrl.net
Message-ID: <Xns915D5CBB392FDAH6OB@24.2.2.74>
Source record: 51836

I have the following item for trade
(not particularly interested in cash:

AEA PK-232MBX TNC

Diamond X-500 Dual Band Collinear Vertical
(2meter/70centimeter)

Radio shack HTX-10 10meter AM/FM/SSB rig
(like new)

Icom IC-28A 2meter transceiver with mounting bracket
(136-174 MHz)

Motherboard with 350MHz Pentium II and 32 MB RAM
(never used)

Heathkit HM-102 2KW wattmeter and SWR bridge

Autek QF-1 Audio Filter

DownEast Microwave 50MHz Receiving Converter
(28MHz IF)

Radio Shack 21-543 DSP unit.

Logitech QuickCam USB
(for Win95/98/Me not for Win2000)

All equipment is in excellent condition
(non-smoking environment)

I am specifically looking for the following
(but all offers considered):

40 ft of Rohn 25 tower

Six meter halo antenna

MFJ Antenna Analyzer

6135. Multi-Elmac Cables Wanted:

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-18 15:19:15 UTC
From: yardleyite@aol.com
Message-ID: <20011118101915.22507.00000873@mb-cg.aol.com>
Source record: 51838

Hello,
Name here is Joe; if anyone has a interconnecting cable for a
Multi-Elmac AF-67, AF-68 or PMR-8 transmitter to power supply or
transmitter/receiver and AC power supply for sale I'd be interested in buying
it. The power supply could be a M-1070, PS-2V, etc. One end has a Jones plug
(15 pin) and the other a round female octal connector (and possibly another
power plug for the receiver)

Thank you for reading this message and 73.
Joe Cro N3IBX

There is no connection that will work between the back of the connector and a 9 pin serial port as the TS-440 has TTL levels and the computer requires RS-232. You need an interface such as the IF-10, also MFJ makes a cheap one. You could also build a simple interface, a search at google for rs-232 and ttl may turn something up. Connecting the two directly may damage the TTL end.

Cross-posted to: alt.ham-radio,alt.ham-radio.hf,alt.ham-radio.mods,rec.radio.amateur.equipment

You can not directly connect a TS-440 to a computer. The rig is TTL voltage ,0-5v swing, while the computer serial port is RS-232 voltage levels, maximum -12v to +12v swing. You either need to build or buy a voltage converter. You can go bought, MFJ, etc. or build one. Search the web there are a number of circuits that are published.

If you still want the pin outs, drop me a note adn I can scan the diagram from my manual an E-mail it to you.

Source record: 51845

Discones have a very wide frequency range.
So they work equally badly over a wide range of frequencies.
I believe the problems are two-fold.
1) the angle of radiation is very high.
2) they're small, so capture area is low.

The wide frequency range is much more useful if you're transmitting.
mike

First he spells it Yeasu, the Yaesu, then Yeasu again. For your information Michael, there is no such thing as a 3 month old FT900. They haven't been making them for years. What do you mean it runs on the "cat design"? Maybe that is why my cat likes to lay on mine! I would bet that 90% of the hams on this ng know more about that radio than you do. Do you even have a callsign?

It is definitely a "Tuner/Bypass switch. Mine works just fine. I would assume that the switch or the
connections to the switch are defective in your unit.

Good luck.

Jack

6150. Need Kenwood TS-430 Power supply

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-19 02:32:56 UTC
From: sapbasis@iname.com
Message-ID: <8455963.0111181832.1a4904ec@posting.google.com>
Source record: 51754

I have a Kenwood TS-430S and need a power supply for it. I have seen that I can buy either the original PS-50 or PS-430 models used for around $100 but was wondering if there are any less expensive alternatives to getting a 20A 13.8V DC power supply? Or if for the same money I can buy a new power supply that will fit the DC connector.

Please CC your response to me email as well.

Thanks,
Todd

Dipole...make your own...you'll learn a lot, and will be able to improvise antennas any time you need to.

Consider multiband alligator clip dipole or doublet configurations, for instance.

Invest in a good swr meter for your bands of interest.

I have a Kenwood TR-7950 2-meter mobile with an ailing LCD display.
After about 20 minutes on, it starts to wash out, till it becomes barely
readable. Turn it off 10 minutes, it comes back on fine, but it is a
nuisance, so does anyone have a display for sale, or a parts rig with a
working LCD? Thanks.

dipole, as has been suggested by DJ

use 6" pieces of 3/4 inch pvc pipe for insulators...suspend with nylon rope

easy to make, build it about a foot or so longer than the formulas indicate,
then trim it for best SWR in the center of your band

I was surfing ebay tonight and saw some reference on an auction that
the US dealers are out of stock on the new Kenwood.

The local dealer in town here has some in stock if people are looking
for them.

Sorry. Not for sale. One of these days - probably when we're snowed in - I will put in a different receiver, replace the oscillator, make the power supply external (it runs hotter than a two-dollar pistol; bad design).

> Steve
> k2pts
>

Hi Steve:

You missed 2 points.

One was the definition of classic.

My dictionary says that "classic" means outstanding, first rate,
consummate. That doesn't translate to it being hard to obtain for
anyone, including cb ops. Classic doesn't mean scarce.

Two was in thinking that a TS-940 is a "regular" radio.

The number of new units sold over the same time window shows there was
little else in the market that compared. Today, the current resale value
of them today further reflects their superb price/performance. Its a
deep set of features that are very well implemented.

What radio of comparable performance comes to mind?

73,

John/WD1V

Don't get sucked into a G5RV or GAP or similar vertical antennas, quite frankly they stink.
I suggest you make some open wire feedline or buy some. Then use a doublet of about 44 ft in length. This is an excellent antenna, and very few antennas will beat this. You will even give low tribanders a run for there money if you can get it up high at about 60 plus feet.

If you only have one support, use it as a vertical doublet this will work every well. Get yourself a good balanced antenna coupler.

My experience using these open wire fed antennas is that they work very very well. Compared to the trapped junk and associated trapped and untrapped verticals you will kill them by several S units.

Bill -

Which Rigblaster model ? [Plus; M4, M8, RJ; Nomic] and for what Radio ?

Start at West Mountain Radio's (builder of the Rigblaster) Support web page
http://www.westmountainradio.com/support.htm

The owner's manual is available here (in Adobe Acrobat format), in case you
did not get yours.

[I as assuming that you have a Rigblaster standard model with M4, M8 or RJ
connector]

http://www.westmountainradio.com/supportstd.htm
This support page takes you step by step through the set-up and diagnostics
for your
Rigblaster, the same steps that their support staff would take you through
on the telephone.

Double check the latest Jumper Diagrams (jumpers inside the Rigblaster) for
your specific radio.
Do not assume that the seller had the Rigblaster installed correctly (may
have never used it)

** If you are running a Yaesu transceiver, note the 2 different wiring
diagrams for the M8 connector.

As they note, check your microphone operation FIRST, before the computer.

Go through the rest of the steps (from FAQ support line) and if you still
have a problem, call West Mountain Radio.
They will ask you if you performed these steps.

Why do you think it is the LCD screen and not a component driving the LCD screen that
if experiencing a value change due to heat?

If I were troubleshooting, I would look for a component in the LCD driving schematic
(dropping resistor for voltage, contrast adjustment on display, etc.) for thermal problem.

Does anyone have any experience of increasing the MFJ-259B analyzer's coverage down to 1 MHz? I have asked MFJ, but have not been able to answer the question.

It looks as if a 100pF across the variable tuning cap will do the trick, but will this significantly affect the accuracy?

Thanks,

Ian, G4JQT.

Not sad at all, Perhaps he wants to use the experience of others to prevent himself from endless experimentation?
Maybe he'd thought of an inverted V, or dipole, but just wanted to make sure nothing else would suit him better. You know, just like as soon as you put up an antenna, everyone and their brother has opinions of better ones. I myself would have tried a dipole at those frequencies, and have.. just for listening purposes. While a random length of wire works, one cut to the right wavelength works even better.

6189. Crystal Radio Sets?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-19 18:33:48 UTC
From: John P Vassel <johnvassel@iname.com>
Message-ID: <3bf9508c$0$37098$2c3e98f8@news.voyager.net>
Source record: 51791

It's Christmas time, and I was hoping to get a crystal radio 'kit' for my soon to be stepson. His geography is great, and I think he'd enjoy listening to places he's only seen on a globe.
Anyways, other than radio shack, has anyone seen any decent crystal kits? I'm aware of DIY ideas, but thought something geared towards a kid (he's 12) would allow him the ability to do it all on his own.
I look forward to the replies here in the group.

Both Comet and Maldol will be releasing new antennas for our Kenwood TH-F6 handhelds next month...right before Christmas.

Preliminary tests indicate improved performance...although we here in Southern CA are so "spoiled" by having so many readily-accessible repeaters that the stock antenna that comes with the Kenwood works very well for us.

Intentionally crossposted to alt.ham[radio.mods and
rec.radio.amateur.equipment.

I have an NYE Viking Phone Patch, with no idea how to use it. Here are some
specific questions...

How do I verify it is working correctly?

What is the Null knob for, and how do I set it?

What is the RCVR GAIN knob for and how do I set it?

What is the XMTR GAIN knob for and how do I set it?

How do I conduct a phone patch with it?

How do I pin it out for a TS-440SAT or other radio?

Thanks in advance!

6194. Thomas Bruckner Scammer?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-19 20:46:56 UTC
From: wr2i@yahoo.com
Message-ID: <8b1c96a5.0111191246.fe95d53@posting.google.com>
Source record: 51796
Cross-posted to: rec.audio.tubes,rec.radio.amateur.equipment

I purchased what was represented as NOS Eimac 3-500Z from Tom Bruckner at a local hamfest. The tubes are one alledged "matched pair" and one single tube. I noticed something smaller than a pinhead rolling around inside the single tube. I attempted to contact Mr. Bruckner about this via email and telephone with no response after many attempts.

I installed the "matched pair" in my 29 year old never had a problem Heathkit SB-220 this past weekend to put some new life into it (what a mistakethat was!). As soon as the amp was powered (switched on)FIREWORKS!!!!! HV took out the bias zener, plate meter shunt and my plate current meter. Obviously there is a short or mucho gas in one or both tubes.

So as it stands, I am out some big bux for tubes and need to find a virtually immpossible to find meter to restore my amp to original. Once again Mr. Bruckner will not return emails or phone calls.

Has anyone had a similar experience? Please email me.

Thank You

Marc

Is the ad on pg.166 of th Dec.2001 issue of QST a GOOD deal?... ;)
I'd always been happy with only having VHF/UHF capabililties while in the city, but after living out here awhile, about 30miles from any repeater (and there's only 3 within 70miles), well.....
I'm mostly wanting to communicate "short-distance" with the locals around here, who're pretty active on HF because of the distance between one another...
Thanks.

By all means, proceed to the Xtal Set Society's web page:
http://www.midnightscience.com/

If you want to cut directly to the kits, hit their catalog:
http://www.midnightscience.com/catalog5.html

The have two really nice kits, one goes for $17.95, the more advanced one is $29.95 and cover up to about 8 MHz.
.
They even have a one-tube re-gen for 29.95, not including the tube and battery case!

Alternately, you could make up "personalized" kit of your own to give to him from the parts sold on this page. Lots of books on here, too.

As always, a google search of "crystal radio", or "crystal set" etc. will undoubtedly turn up more of vendors as well.

Good luck, and I hope the bug bites him just as it did me in 1968 and my dad in 1928.

Mr. Bruckner got into me, for about $750 on a pair of 3CX1200D7's which were repersented by him as NEW, never used.
To make a long story short, I did not install the units until two years later (after "his" warranty expired)
Nothing but trouble from these tubes, damaged my amp severely.
I sent them to EIMAC in Cal. for testing.
They told me that these tubes were in-fact used(heavily used!), and had been "cosmeticly" treated to look new. Both tubes failed every test EIMAC performed, and one had a grid to filament short and could not be tested.

I resloved at that point to NEVER purchase a tube of any kind from him, no matter how cheap the price.

You mentioned you want to work 20 meters. A wire dipole for that band is only about 33 feet long. If you cut it, resonant to the frequency you want to work, you don't even need the tuner, and you can feed it directly with coax. That's about as cheap as you can get -- two 16.5-foot legs of wire and a hunk of coax.

I think every ham starting out should just build a simple dipole, and go from there. That's where I'd start. You have the space. The dipole will outdo any of the fancy verticals or G5RVs or whatever.

Start with a dipole cut for 20 meters. While you're at it, get the ARRL Antenna Book, which will detail all of the construction techniques you'll need, and show you how to build more complicate antennas, later.

6204. problems with tx on usb has me baffled

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-20 01:12:33 UTC
From: emeraldj <n2nrv@hotmail.com>
Message-ID: <Xns915ECE62120Bn2nrvhotmailcom@24.24.0.14>
Source record: 51707

My rig is an icom ic-701. My antenna is a random wire attached to an MFJ VersaTuner II. Everything seems to tune up well, but when tx'ing using usb the rig seems to send a steady carrier. However this does _not_ happen when using lsb.

When I key the mic on usb I see no signal (this is expected), but the moment I make the slightest sound that the mic can pick up, the rig sends a steady signal for as long as I have the mic keyed whether I am speaking or not. I haven't noticed this problem when using lsb. Tx'ing on usb also caused a loud rushing noise to be heard on my computer's speakers, again this only happens when using usb and not lsb or even cw at the full 100 watts.

I've used usb on 20M 15M and 10M the problems are the same for all three bands, I haven't been brave enough to try usb on the other bands or lsb on 20,15, and 10.

Does anyone have any suggestions as to what I should look for or try? My test equipment is limited to a multimeter with continuity check, so sadly I won't be able to put any suggestions that require an o-scope to good use.

Tnx in advance
Fred - N2NRV

The 718 w/microphone sells for $599 at AES. Add the no-name power supply for $100 or so, and the other bits and pieces, plus shipping would bring it to $800 or so. Fair price. And it would be a good starter setup for hf, assuming you have the room for the g5rv -- it's about 100 feet long. Otherwise, a 66 foot dipole for 40 meters would give you decent contacts around town.

On my 599zx with the V5.0 update, you go to Setup, then select "About" with the left knob. That will tell you what you need to know. If you are planning to upgrade, be aware that you lose the two-tone generator function with the upgrade. If you don't care about that, the upgrade is good.

I've met and done business with Thomas Brukner and his charming wife Maryjane on several occations and never once have I had a problem nor have I heard of anyone EVER having a problem with him until now. Tom has sold me V70D's and Eimac 3-500Z's at a more than fair prices. His prices always have seemed to be the best I could find. I'm sure he must have stepped out for the holidays if he hasn't returned your call. This really stuns me as Thomas and his wife are some of the nicest folks around. Sorry, I can't put any stock in your remarks.

You mention your computer. Is it connected to the rig for use on RTTY? Is it capable of sending audio into the rig via a rear-panel connector? Is it capable of controlling the PTT line of the rig the same way?

Obviously your computer is picking up the signal, but it could also be sending one out to the rig in the form of feedback. If the rig's audio input is alive while the front panel mic is being used, it can send audio right back into the rig. Most RTTY modes use USB if there is no separate RTTY setting on the rig.

Disconnect all accessory cables from the rig and try it. Beg, borrow, or steal a good dummy load with as short a cable as you can find. Try your experiment again. Let us know what you find out.

My computer is not even on the same floor of the house as the rig is.
the rig is in the basement, computer is on the first floor. There is
no connection between the two. BTW, IC-701's do have a separate RTTY
setting. I could go so far as to disconnect the speakers from the
computer and still have the noise from my transmit.

At the suggestion of another person I talked to I switched back to
having the antenna fed as a dipole with twin lead rather than feeding
it as a long wire. The idea being that there is rf getting into the
mic and doing bad things to my signal. That got rid of the steady
signal, I also checked the 10M band using LSB and that had the steady
signal before I 'fixed' my setup.

Now that every thing works again, I have lost my match on 160M. I
can't get any better than 2.5:1. Looks like either give up on the top
band or add more wire to what I have.

A better question is why anyone would spend $750 on tubes at a hamfest
that they couldn't check out on the spot, or would wait two years
before checking them in an amplifier, or would even consider sticking
a 3-500Z in an amplifier if it had junk floating around in it...for
that matter, how'd he walk off with the tubes without hearing or
seeing this?

I could understand a clueless guitar player doing this with a pair
of 6L6's for $10 and blowing out his screen resistors, but the amps
these tubes go in have thousands of volts in them and you've got to
have a license from the FCC (and take a test to get the license)
to even legally flip the power switch on an RF amp that's got
3-500Z's in it.No one in these cases fell off the proverbial turnip
truck, they're both quite cognizant of the fact that real, brand-new
Eimac tubes of these varieties cost substantial money and instead
elected to buy off price stuff.3CX1200D7 for $750 a pair? No, I don't
think that's going to happen for new, factory warranteed tubes,
and even if one could, the Eimac warranty isn't 2 years, anyway.

Hi:
I've got a Yaesu FT-212RH modile 2m transceiver in very good
condition that I'd like to sell. This radio was only used for a
short time to play around with packet in the shack and is clean
and smoke free. Specs are:
144-148 MHz
5W and 45W output
LCD display - backlit (orange - variable brightness)
18 channel memory
scanning & priority channel
(mic not included - was used only on packet)
$110 US shipped in NA

From: Robert Greene <rgreene@pivot.net>
Message-ID: <3bfa5caf$1_4@corp.newsgroups.com>
Source record: 51728

I'm thinking about getting a new mobile/base 2 meter rig - does anyone have experience pro/con with the IC-2100 H?

Will it allow storage of an out of band receive frequency in memory, and then allow that memory channel to be scanned?

Any experience with the pc software? I haven't seen much by way of description/functionality. I assume it just allows readout and programming of the memory channels - right?

Thanks in advance.

Just wondering if anyone has had any experience with memory backup failure in a Kenwood TM-221A 2m rig. According to a tech at AES,
the lithium battery is good if it is 2.2v or better. Mine measures 3.2v. Not bad for the original battery! Is the battery actually
supposed to be around 5v and at 3.2v it's no good. The tech at AES also mentioned that it could be another problem but didn't get
specific. I would appreciate hearing from anyone that has experienced this problem. TIA.

Glenn Butzlaff, WE9K

Hello. I have a Motorola Maxtrac, model # D43MJA7JA5AK, 146-174 MHz, 32 channel, 45 watt w/ the 16 pin logic board, yes it does all signaling options. I would like to trade this unit for a Maxtrac/Radius Lo Band mobile in the 42-50 MHz range. I dont need 32 channels, 16 would be good. It must scan and be in good working order. The unit I have is in used but good condition, not all beat to death. I want to trade unit for unit, no accessories are needed. Please Email me direct with what you have including specs and model #. Thank you in advance!

Hello. I have a Kenwood TS-680S that I have a question in regard to the TX audio. I have recently wired a Astatic D-104 amplified mic to, however upon keyup, it takes a second or so for the full audio to catch up. Its almost like a dead carrier at first, then the audio kicks in. I dont know if it has something to do with the speech processor or not. Is there a adjustment that can be made to prevent this from happeneing? I would like to continue using the desktop mic verse the stock hanheld mic. Other then this, I love the radio. Any help would be greatly appreciated! Thank you in advance!

Thanks everyone for the great suggestions! I was originally
considering an inexpensive vertical like the 6BTV but after getting
all your responses I think I'll start by expiremenging with the
various dipoles such as the inverted V and sloper (since I only have
one tree to work with). Besides, building my own antenna will increase
the nerd factor which is always a plus.

After many, many, many tries - emails, phone calls, etc.. - and
despite my best attempts to do so, I have never actually been able to
get Mr. Bruckner, or Tubos as he sometimes calls himself, to actually
sell me anything?

I tried - he promised, said he had stuff I wanted, dropped tantalizing
emails about new, rare discoveries - promised to be ready soon - but
was never able to actually finalize an order! Every time I said to him
'ok, how much money do I send' he either made an excuse or didn't
answer!

So, unfortunately, I have never had either the pleasure of being
ripped off by him or receiving tubes from him.

I gave up. I came to the conclusion he is just a wanker who likes to
play but never comes through.

The Bypass position on my MFJ Tuner bypasses the tuner, IOW it directly
connects the Radio output to a a separate connector on the back of the
Tuner. So if nothing is connected to THAT connector then the SWR will
be all over the place. I keep mu dummy load attached to it.

Cheers es 73,

Hi Glen,

The problem is in the CPU, not the battery. Most of the time the defective CPU will also cause an excessive current draw on the lithium battery while the rig is turned off, but this does not happen on all units.
I fought this battle several years ago and began by replacing a lithium battery that was below the required potential to sustain the memory. The replacement battery went down in only a month and I began searching for the root cause. That is when I found out about the CPU problem.
Since the rig was being used in my truck where it was always connected to the 12V car battery, I removed the lithium battery and replaced it with a dropping resistor and a zener diode to simulate the lithium potential when the rig was shut off.
This fix will work as long as the rig is always hooked up to the 12Vdc source but in my case it beat replacing the CPU (and lithium battery again).

Six Capacitors, Oil Filled, 35 mfd 2000 volts - Ebay

I purchased these at the Dayton Hamvention a few years ago for $60. There are six, all of them 35 mfd, at 2000 volts, oil filled. (I was going to build a big amp, and use them series/parallel to give me 52 mfd at 4000 volts). The dimensions of a single capacitor case are: 6"x 4"x 3". There is a set of mounting clamps for each capacitor.

For auction on Ebay, click on:

Other items:

Running Time Meter, Measures Hours

This running time meter reads in hours and tenths of hours. Timer scale is 10,000 hours, and currently reads 0.2 hours. This meter runs on 115 volts. It was made by Industrial Timer, Model C-25, and it is still in production. If interested, I'll send you the manufacturer's PDF file that describes the meter's specifications. It is in very good condition.

For auction on Ebay, click on:

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-20 23:37:44 UTC
From: davearea51@aol.com
Message-ID: <20011120183744.27663.00000847@mb-cf.aol.com>
Source record: 51743

A crystal set is fine, but it needs a good antenna, and will not receive foreign broadcast too well. ONLY the strong ones. I'd suggest two sources:
1) TenTec has a very nice regenerative receiver that is quite a performer for its price and simplicity. It is a kit and requires minimal tools. You can find them online.
2) Lindsy Books or Lindsy Publications. This source has many, many books from smelting to turn-of-the-century physics to electronics. He offers plans and kits of crystal radios, single-tube regenerative receivers, etc.

If you still want a crystal set, try the Crystal Radio Society, also online. They even offer "short wave" crystal sets.

All things considered, I'd consider TenTec kits.

6242. Antique Thordarson Spark-Gap Transformer - Ebay

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-21 00:15:27 UTC
From: Dan Long <w4tq@mindspring.com>
Message-ID: <9teroh$2ii$1@slb3.atl.mindspring.net>
Source record: 51648

Antique Thordarson Spark-Gap Transformer - Ebay

This is an amazing device that was probably made in the mid teen's of the previous century (has a patent date of 1908). It is a Type "R" ½ kW, 110V, 60 cycle Wireless Transformer with a 10,000 volt secondary. It has a movable core section that is operated with a lever. I have not made any attempt to clean it, or otherwise improve its appearance. Although I can find no evidence of any burns or electrical damage, I have chosen not to apply power; and accordingly, I am not guaranteeing functionality. This is a very high voltage transformer, and I'm not sure of the longevity of the insulating materials.
One of these is featured in the Western Historic Radio Museum in Nevada. See their online picture gallery at this URL:
http://www.radioblvd.com/WirelessPhoto.htm

This text appears in the Wireless Museums description: "These high voltage transformers were commonly used in amateur spark stations. The primary is keyed via the AC line (with kickback preventers) and the secondary connected to the closed circuit (usually an oscillation transformer, charging condenser and rotary spark gap.) On a 1/2KW transformer the secondary voltage is about 12KV. The sliding section moves a portion of the core in and out allowing for adjustment of the current capability and resulting power output. The Type R sold for $21 in 1917."

To start with, would you do that to a set of tubes bought from RF Parts Co.
?

Well, Mr. Bruckner was reputed to a "good" commercial dealer. All the tubes
he sells are "called" NEW by him, and from all appearances they look NEW.

6247. Programming Cable for VX-5 / FT-8000

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-21 02:41:19 UTC
From: Dave <dalden@home.com>
Message-ID: <AC2DF4432B13B3A7.46B595A57DF26728.8BC443C38CB82B42@lp.airnews.net>
Source record: 51652

I own a Yaesu VX-5 along with the ADMS programming software and cable.
I just bought a Yaesu FT-8000R mobile and can get the ADMS software
for it but what I want to know is if I can adapt the VX-5 cable to
work on the FT-8000R.

The VX-5 cable has the DB9 connector on one end and a regular 3 pin
Mini plug on the other. The 3 pin mini plug is then fitted with an
adaptor that converts the 3 pin plug into a 4 pin plug for the VX-5.

Pinout on the VX-5 3-pin mini plug is:

Ground : Ground
Ring : Programming
Tip : Not used

The FT-8000R Data Jack pins are as follows:

1 - Packet Input
2 - Signal Ground
3 - Ground to Transmit
4 - 9600 baud packet data output
5 -1200 baud packet data output
6 - Squelch

It seems to me that if I make an adaptor to connect the mini plug
programing connector to Pin 1 packet input and run ground to ground,
it should work. Has anyone tried this?

Thanks!

Don't know where you live, but around the southeast area of the country, we have Cracker Barrel stores. They offer old-style meals, etc., and each store also contains a gift shop. We bought a crystal set for a young boy who has just been adopted by a couple at church. It was very inexpensive and looked to be easy to build.

The crystal radio websites are excellent places for these (as has been mentioned), but the set I found at Cracker Barrel is good enough to peak a boy's (or girl's) interest.

My experience with Texas Towers out of Plano, TX

Hello all. My Name is Brent and my call is N9BC. I would like to tell everyone about my experience with Texas Towers. On Monday 10/15/2001 I decide to buy an ICOM 706mk2g. After scouring the net I found that Texas Towers seem to beat everyone by about 30 bucks. So I went and gave them a call mid afternoon to place the order. Someone picks up I believe his name was Brian. He was very pleasant to talk deal with. The deal they advertised was $869 with free shipping sounded like a good deal so I opped for the over night shipping for an extra $33 still not a bad deal! So I finished up the order and hung up.

All night and a good part of the next morning I was all excited about getting the rig. About 9:30am it gets here WHA HOO!! Open the box up start taking out the parts to the radio. So far so good next the rig. Take it out of the plastic what do I see a BIG black bloch across the LCD. I was horrified! I couldn't believe it. After a few choice words out loud. I called Texas Towers to let them know. They asked if the box was damaged it wasn't so they said it must of happened at the factory. So he said ship it back and they will ship me a new one. I said I guess so. So I hung up.

I sat there looking at the broken radio and decide to call them back to see if they would overnight me a new radio if I overnight this thing back. Got Brian back on the phone he said he needs to talk to the boss. 2 sec later he said sorry no can do. I'm like what? You are kidding me! Nope if you would like it shipped back to you overnight you will have to pay for it. So I said ok thanks and hung up.

Off to UPS I go. I get there and ship the thing back to them overnight. So that is another $33. I get to work a few min later. Sitting at my desk festering about the whole deal. I call them back and ask for the manager. He gets on the phone. I tell him the whole story and he said no sir we can't do it we don't make very much on the radio that is why we are the cheapest on the net. I said if you ship it back to me overnight I will do business with you again in fact I will place an order of $400 today with you. Still he wouldn't do it. So I do the good ol' saying I will never do business with you again. And hung up the phone. Boy was I mad! Now it is Friday and still no radio and I really wanted it for the weekend. So I broke down and told them to ship it to me overnight with Sat delivery another $45 for shipping. Got it on Sat as I was on my way down to AES to get the rest of the order. I sure wish I would have just bought it from AES to begin with.

Anyways I would never recommend TEXAS TOWERS to anyone. So beware they have no customer service what so ever! CS is very important to a business

apparently they don't believe so.

Thanks for reading,

Brent

I am new to the hobby, but I have a 2100 that I have enjoyed using quite a bit. It's menus make sense and it is very easy to learn to move around on. I will try to remember to try the out of band trick you mentioned. I use it as my base station at home. I can't wait to be able to put it in my vehicle, currently I use HTs when mobile.

It is just good salesmanship... that's why they should have overnighted the replacement. If the customer isn't happy, ain't nobody happy. That is what I learned in the retail business some years ago.

I ordered a radio from Gigaparts. They said the radio would be shipped the next day. Two days later I check with them to get my tracking number and the radios didn't come in so they could ship them to me. They offered to send the radio out 2nd day UPS. Which the shipping department screwed up on and sent them ground. I called them back and he offered to send me two radios over night and to just refuse the first two. Would most companys do that??? The guy I deal with promised me a deal on my next order to make up for the problem. About a month later I ordered another radio from them. The man I deal with wasn't in so somebody else took the order to give to him since he didn't know our deal. Somebody screwed up the order and they sent it out COD. After they tried to deliver the radio COD I called them back. They overnighted a check to pay for the radio. They have screwed up twice but have done anything the could to make it right.

They would have kept my business if they would of even met me half way on the shipping. is it too much to ask for? Even if they didn't make a hugh profit on the last sale I'm sure the would have made it up for it over the next few months from me. Now I don't mind driving down 1 1/2 hrs to AES. In the last month 1/2 I've sent down there a good $700. Just for grins I ask the salesman at AES if the same thing happened to me with them would they of shipped it back overnight. He said of course we would have. We shipped a defective product. Sure sounds like they have their act together.

I dont want this to turn into a big flame. I just wanted people to hear me about my experience with Texas Towers.

I have an Azden PCS-3000 2m mobile that was used for packet. Have no idea
where the mic went. This is an older mobile and can be used for packet,
APRS or ???
I has 25w out, all kinds of buttons and knobs. Has a tone switch also

Don't know what it's worth.

How about $80 obo shipped COD, prepay or PayPal

Hi

I know, this is my first post, and I bet this sort of question has been asked a thousand times. So let me make it 1001.

I've just decided (well over several months/years) that I need an all-mode wide-band receiver. I need big-time advice here.

The sort of price range I have would get me one of the following:

1) Yaesu VR-5000
2) AOR AR3000A+
3) Icom IC-PCR1000
And an antenna (or two).

What I'd like to know is, which one is best? What are the defficiencies of the others?

I know it's a bit vague, but I've got to start somewhere.

Thanks,

Bill

I'd contact the Better Business Buro and the Texas Division of Consumer Affairs. You paid for overnight shipping on a working radio and you never got a working radio shipped overnight. The BBB will contact them and ask for whatever you want (ie: All expenses beyond the initial $869 and $33 shipping). If they don't reply or refuse to cooperate, it will be a matter of public record for potential customers to see. Even it there's nothing illegal in it, having a bad report with the BBB on record can cause prospective customers to shop elsewhere.

yeah, right

I hear that line all the time in the transmission business, usually from big companies:

"Give us a price break on the first one and we'll send you all our business"

then, guess what? they conveniently forget that the first one was at a 'special price' and want that price for ALL of them.

sorry, man, you got what you paid for.

Hi:
I am in the market for a soundcard to rig interface. I would like to compare and contrast the Rigblaster versus the MFJ-1275. There was also a third commercially available interface that I heard about recently. Unfortunately, I can't remember the name. Thanks for any comments on these devices.

Hi Gang,

I'm having trouble with an FV-102DM. I power up the 102, after connecting the vfo, and all the VFO does is cycle 0's , or other numbers through each digit, one digit at a time on the display. Is there a way to reset this thing? Any help would be appreciated.

Thanks,

Nick N0KQ

The interface circuits are not anything special. Any of them should
work about the same. It is all audio circuits. Look for the Rascal as
it is about half the price of the Rigblaster. Sorry that I don't have
the url handy for them. YOu order it for the rig you want to use it
with. It does not seem to be gold plated or anything fancy but the
internal circuits seem to be fine looking at the circuit drawings on
their web page.
They even have a kit for under $ 30.

6274. Re: Thomas Bruckner Scammer?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-21 15:40:08 UTC
From: wr2i@yahoo.com
Message-ID: <8b1c96a5.0111210740.3235e923@posting.google.com>
Source record: 51679
Cross-posted to: rec.audio.tubes,rec.radio.amateur.equipment

Well here is a follow up since someone didn't read my post carefully.

The SINGLE tube I purchased which I NEVER tried to use has a blob SMALLER THAN A PINHEAD rolling around inside. You really need to look carefully to see it. I didn't see it until I inspected the tube later on at home. It was then when I tried MANY times to contact Mr. Bruckner via telephone AND email. I received NO response then which was NOT a holiday week. I then later tried the "NOS matched pair" in my amp (and yes I have an FCC licence since 1975 EXTRA CLASS to be specific), no I am not a newbie, I am in the radio communications industry as a profession and the price I paid was market value...not a bargain price. His website reflects the current price of Eimac 3-500Z's to be $480.00 for a matched pair, and $234 for a single tube. These are claimned to be NOS.

The tube(s) wasted my perfectly good amplifier, which I repaired and is working on the ORIGINAL EIMAC DATE CODE 1973 3-500Z's minus the plate current meter which was wasted thanks to my Tom Bruckner special tubes. It is obvious that these tubes were junk and sold as new. He still will not return my emails or phone messages.

I made many inquiries on this "dealer", all of which resulted in a HUGE negative response. No one person had anthing good to say about him.....some of which were people that had never spoken with me before. Apparently, this Mr. Bruckner has a history of dealings similar to mine. He seemed like a decent knowledgeable man to deal with, but will not respond to me which IMHO is dishonest business activity.

In <W3FK7.18880$3s2.1076661@typhoon.kc.rr.com>, "Brent" <brent316@yahoo.com> writes:

Hi Brett..

>My experience with Texas Towers out of Plano, TX

.. Sad experience snipped .. but not in jest here .. just for space

>Brent

>N9BC

I have known Gerald, his son, daughter, and the group for MANY years. This family is a top notch very capable and very sincere group. I've dealt with them in person at the store, in person at the hamfests, by phone, by mail and via shipments, you name it; we've done business together. I've sat down to dinner with the man in Richardson, even been invited to his antenna farm out Northeast of Dallas.

That full sized three element rotary array up there at 190-odd feet run by a large prop pitch that uses 105 feet of Rohn 25G for a boom and 4 inch irrigation pipe is a beautiful job, But you have to know a little more about it to really know about this man and how much respect most people I know have for him. It's the SECOND time that array has been put up there Brent.

The first time it went up, Gerald had help from the local crew. As you can imagine, playing that game with 130 foot elements and the equivalent of Rohn 65-G for the tower isn't exactly lightweight stuff. And the man on top the stack *IS* the boss on tower work like this, if you've ever been there Brent, for good or for horror. Things do go wrong,,,

As I understand how it happened, Gerald got in trouble with the last Phillystran guy and didn't have the right thimble bolt to attach the guy run to the tower top. So he used a Rohn 55G tower leg bolt on what he told me was a 'temporary' basis, just to get down the tower and finish that day, Everyone was dog tired, enough is enough. I'm sure from your post that you know the feeling...

But he forgot about going back up that 195 feet to replace that substitute bolt with the right one. And Texas isn't very nice weather wise at some times of the year. Along came that massive frontal passage and .. that tower leg bolt snapped and down came the whole thing, tower and all. I'm sure, from your post, that you know the feeling, maybe from a different perspective, but you do have a way to relate to this.

If you happen to be on the place, there is a section of tower still plugged into the ground at a crazy angle where it augered in. Gerald said he left it there just to remind himself of his mistake. And, yes, that whole thing went up again a SECOND time. But not quite so much in the grand show as round one.

For, as I understand it, in 'payback' for all the wasted time and effort Gerald caused the local crew, by not going up and taking care of making it right the first time, as I was told, he, with only the help of one other feller on the ground, put round two up all by himself to make it right with his own insides for what he caused on round one. This is the kind of man and family you are dealing with Brent. He is a horribly honorable man and a prize contributor to an awful lot of people in this hobby Brent.

You need to know a little more about the profitability in business, in general, before you can fairly judge some things like this. Most people do not know that over the last 50 years or so in the USA, the average bottom line profit for all businesses is only about seven cents (7 pennies!) on the dollar at the end of a year. That includes GM, IBM, Ford, a whole bunch of dot.com's that lost tons of money, mom and pop grocery stores and folks like you and I and Gerald! It's rough out there Brent; bottom line on a $600 radio isn't over $40, if that. Ten years ago when money meant a little more something, I knew that Gerald needed an average of over $8000 a day on that 1-800 watts line, just to break even! And that's not to turn a profit, just a wash.

It takes about $350,000 worth of equipment sales just to pay either someone else or yourself only $24,000 a year, Brent. Oh sure there are great deals and high proced time and all that. But bottom line is that the old interest rate figure on the US Government long bond is there at that rate for a real reason! Free enterprise does have it's rewards, but Socialism is right there just under it to always think it can do it better, friend Brent! Huge grin!

More important, you have to realize the reverse is true! If you lose a $600 radio and don't get paid for it at all, at seven cents a dollar net to the bottom line, you will have to sell almost $9000 worth of new sales just to break even with what was lost! That $40 loss taken three times in the shuffle on your deal would mean someone has to do almost $2000 in new business down there just to pay for it.

In the average business here in the USA, even if a minimum wage employee poofs away one $7 hour or so, it takes $100 through the register just to recover that, what at first, looks like such a trivial deal. Yeah I know, you'll say you don't believe all this with what doctors and lawyers and Indian Chief's all make and so on, but, sadly, it is true.

A whole series of events in the world that are rather scary are teaching this lesson of bottom line profitabilty to a lot more folks right now. It is so easy to not realize just how thin the ice all humanity skate on; is. Even though the numbers are in the billions, the percentage of what's left over is still the same, still the same.

As far as I know from many years of dealing with Gerald, this man has done everything possible to put back every cent of what his family has ever managed to wrench out of life, back into something that will bring a better day and a better world for everyone around them. And I used the proper term in what it has taken them to stay functional.

I had a similar experience with a brand new FT-1000 I bought from him! It had a dead output RF amplifier section on arrival, right out of the box! But knowing what I've attempted to convey to you above, I gladly paid for the shipping and all, both ways. I found, as I usually do, that, as it has been long 'Fabled' grin, even the smallest kindness never goes un-noticed. He's long since contributed back to me far more than that I spent to help him.. Far more...

--> Sleep well; OS2's still awake! ;)

Brent,

I would say since you paid for an icom 706 on your door step the next day, you should have one as advertised.
I would think they should have refunded your shipping cost, since you had to return the radio or at least sent the new one overnight at no cost to you.
I've been a ham for 8 years and have had this type of experience with most of the ham stores. They expect the consumer to bend over at the drop of a hat.
Thanks for the heads up on Texas Towers.

What nerve this cheapskate guy has!
....Let me get this straight....he starts off saying something like "I scoured the country for the lowest price in the world on an Icom 706... (which was probably a whopping huge $30-50 or so less than his local Radio store on this $900 item, which he then illogically pays $33 extra for overnight air?)" He then finds a factory defect, calls the mail order place, which says "No problem", ship it back & we will get you out another". & is mad because they won't pay $35 out of their pocket to ovenight air the replacement!!! How about demanding that they just "throw in" $45 worth of radio accessories & ship it regular...same loss out of their pocket. He's lucky they didn't just tell him factory defects should be directed to Icom! , which many do.
When you look for the lowest price in the state for a gallon of gas, don't expect full serve, a windshield wash & free cup of coffee, & don't complain that you didn't get it.

I found that the D104 I was using had a "POP" as the amplifier came on, and it would cause the AGC to cut back the gain on the mic circuit. They try to control this by having the power contact close well before the "audio mute" contact opens. I fixed it by taking power from the rig, not the battery, and having the amp run all of the time.

I'm obviously in the minority here. I've had many dealings with Tom over the past 20 years and found him to be very honest and reliable. In the rare case where I had a problem, he was quick to make it right. He also does a lot of broadcast and industrial business where he maintains a good reputation. He's certainly isn't a fly-by-nighter.
I will admit he can be very difficult to get in touch with-especially by e-mail. BTW, his website is www.tubes4u.com .

Thew question might better be asked of a newsgroup dealing with shortwave listening, but for the money you are going to spend on one of these, you might buy a good mid range transceiver thought would serve double duty.

You're right as rain on that count Bobby....I also "scoured" the internet for lowest prices some years ago when TS450S's were still being sold and Texas Towers had the best price by over $100. Fortunately the one they sent me had no factory defects and still works to this day....

More recently I once again "scoured" the internet for the best price on an Ameritron AL-811H..and once again Texas towers had the best price by over $50....

Factory defects are not the fault of the retailer..IMHO Texas Towers was more than responsible in their dealings on the factory-defect IC-706.

I would happily deal with Texas Towers again.....

There isn't even a real need to use one of those boxes, unless maybe
you had a rig that was really tricky to wire up for transmit. I don't
use one at all here. I go straight to the soundcard from the radio
out, and straight from the soundcard out to my mike preamp on the 706
or straight to the mike input on my 830 with a small buffer circuit to
drop the level down a hair. You don't need any of tha fancy stuff
unless you just want to spend $$$$. MK

Hello there,
Does anyone have or know of any mods for the ALINCO DR-610T Dualbander?
I would really like to be able to recieve the 800 Mhz public service
band as our local Police and Fire are on these frequencies?...
Any help would be greatly appreciated!
Thanks very much,
-Russ

I agree with that. I unplug the mic from my icom706 and plug in to the sound card. The 'interface' is two resistors to cut the level out of the sound card , something like a 100K and a 1 K resistor. I also did about the same with a Yeasu 757.

It just seems that not many hams seem up to even building that "interface" .

With the profit margins low, you can't blame them for not paying
the shipping charges on the replacement radio. With all the ham
radio dealers that have gone bankrupt in the last 5 to 10 years,
it's not going to be long before there will only 2 or 3 ham radio
store names left in the country. Texas Towers is one of the FEW
privately owned stores still operating, as most have either gone
bankrupt or been bought up and closed by the larger chains.
Even some of the larger ham radio dealers, like AES, are on
shakey ground, financially.
>
>I think the customer was way too impatient and spent a hell of a

>lot more than he needed to on shipping, and that his impatience
>is the main source of his irritation, but he did pay for the
>service his impatience demanded and he didn't get it. I think
>I'll rule out Texas Towers as a potential supplier.

I don't think this customer was patient enough. If he had been more curtious, Gerald, K5GW, might have been willing to split the ground shipping charges with him. Shipping charges on most all mail orders are not refundable, especially special shipping charges, which this person requested. I don't think it was fair to expect Texas Towers to spend what little profit they made on this radio to pay the shipping , especially overnight, charges of this replacement radio that he received.
More than likely, this customer started demanding that Gerald pay the shipping charges. Anyone that know Gerald, knows that that is not the way to treat him, Gerald, if you want him to do something for you.

You are right on the software, I have an ic-2100H, have used it in the house here for a few years, it does what I want it to. I think it will save an out of band freq in memory, I don't have any in there now but seems I did do that once, it will scen what ever is there. Really, for the money it is a great little radio I have no regrest with mine.

See if you can try one at your location first.The front end isn't very selective and can be easily overloaded.When I tried a couple of them here there was an "S" 5 signal across the band all the time and when a particular VHF or UHF repeater keyed up I had a full scale signal on every freq including the extended receive.I couldn,t even hear a repeater that was 5 miles away and line of sight.TG\

I've been pretty happy with mine, except for the fact that the tuning knob
fell off somehow... haven't really tried to get it to stay on, tho.
It will store out of band and allow you to scan... I have several law
enforcement and noaa freq's programmed in.

Best of luck to you. You should be happy if you decide to go that route.

Date: 2001-11-22 11:03:23 UTC
From: Willem Melching <willem.melching@hetnet.nl>
Message-ID: <9tim3k$lp1$1@news.surfnet.nl>
Source record: 51609

Hi

I am using the demo-version of Lowe Samrt Control 32 to work with the Lowe 150 receiver. Unfortunately it is impossible to register the program since I live in Europe and they only do this for American customers. Does anyone know a way to get this program into full functioning? Or is there hardly a difference in working between demo and registered?

Thanks in advance

Willem Melching (Netherlands)

I was actually in there yesterday (physically). Keep in mind that this is a VERY small group of people trying to eek out a living. Thier show room is probably 20'x35'. Even though everyone looks the same size on the web, they are not that big and were probably doing thier best with the margin they have available.

6311. Startek 1.2 Ghz Frequency Counter - Ebay

Startek 1.2 Ghz Frequency Counter - Ebay

I purchased this Frequency Counter new at the Startek counter at the Dayton Hamvention a few years ago for $132. It includes the antenna, carrying case, power supply, and manual. It operates on batteries, but includes an AC adaptor (which also charges the batteries). Excellent condition.

For auction on Ebay, click on:

I suppose you could do all that -- contact the BBB, etc. But it seems like a mean-spirited thing to do to a small ham radio dealer that's been in business since at least the 70s -- that's when I was last in their store. This dealer seems to have a lot more supporters than detractors. If you don't like their handling of shipping charges -- get over it.

Of course, we have not heard Texas Towers' side of this episode. So I'd take everything Brent says with a grain of salt.

Have a happy...

Bob

Triplett 100-0-100 Microampere Meter Model 420 - Ebay

This is a very nice meter, with perfect movement. 100-0-100 microamperes, DC. The bezel dimensions are 4.625 x 4.125 inches. A 2.75 inch hole is required for mounting. Flaws: 1) One of the four mounting screws is missing, leaving three. 2) On the left side of the front bezel at the back, there is a 3/4 long by 3/32 wide area that is partially broken away. If a perfect appearance is important, this flaw could be easily patched after mounting, although I don't think many people would notice it if they didn't know it was there.

Wrong, he didn't get what he paid for. He paid to get a WORKING rig the next day. He did not get it. He got a broken rig. Why should he have to pay AGAIN for overnight shipping. Plus, how often do you here the excuse, "It's not our fault, its the manufacture's fault." They are the ones I you paid your money to.
Bottom line, Texas Towers did not live up to their agreement. From the original post I also gather he had to pay return shipping for an out of the box defective product! What a rip off.

Consumers should always verify the following:
1. The actual return policy.
2. Verify with UPS, FedEx, etc what the ACTUAL shipping charge would be. This is where a lot of mail order places really make their money, over charging shipping.

This is not just a Texas Tower problem. It is nation wide. Buisnesses now think that they are donig YOU the favor just to take your money.

Speaking of transmission buisness. Why is my price ,off the street, for a transmission DOUBLE what is charged to other parts houses, garages, etc? Mine went out and the cheapest I could find was $2850. My nephew was the manager of an Auto Zone, He called tha same place and bought it for me at his price, $1400. No wonder there is such a market for chopped/stolen auto parts. The real theives are behind the parts counter.

"...Wrong, he didn't get what he paid for. He paid to get a WORKING rig the next day. He did not get it. He got a broken rig. Why should he have to pay AGAIN for overnight shipping......"

As 98% of the response to this thread agree, He did get what he paid for...a New, unopened Icom 706. The Better B bureau, Consumer affaris etc.. would not waste their time on his claim because the Retailer did not do Anything wrong or illegal.
Discount mail order companies are under no obligation to provide unlimited free overnight shipping on exchanges, (or even do exchanges), & NO new Product can reasonably be called "working", unless a salesman takes it home, unseals it & plays with all the functions for a few days. If Texas Towers shipped him a Kenwood FRS radio when he paid for a '706, then a case could be "Reasonably" made that he didn't get what he paid for. Even Icom, Kewood, Yaesu Don't pay for shipping back on warranty, nor do they send back warranty repairs with free overnight air. This guy's post strikes the Majority of people that responded to it as being Extremely selfish, impatient & unreasonable.
How Anyone, who admits to "scouring" the country for the dealer with lowest price on the planet for the 706, could then expect a level of service that the highest priced dealer wouldn't be expected to give, is unbelievably Arrogant.

Three weeks ago, I e-mailed both Texas Towers and AES and asked what they wanted for an Outbacker Perth, a Tri magnet mount and shipping. I received an automated reply from AES immediately confirming my message and saying they would reply within 3 working days. 48 hours later I had a reply from AES, I sent them a money order for the gear and less than one week later was using the Outbacker (great antenna!!). Guess what? I still haven't received a reply from Texas Towers! I think they need to work on customer service.

Wrong, wrong, wrong. They are the dealer, they took your money, they are responsible for delivering a new working product as promised. If we go by your logic, then an auto dealer can tell you to ship your car back to Detroit/Japan to fix any manufacturing defects, at your cost. Or, you special order a black car, but do to a production mistake you receive a white one. Can your dealer say ooops, we can get the right one, but YOU have to pay for the original shipping AND the return shipping to the factory on this one.

Any defect reimbursement problem needs to be addressed by Texas Towers to their supplier. Why should the end consumer have to pay MORE money, even in shipping, then the original cost. That's making the CONSUMER responsible for others mistakes.

Jeff, I'm not in the ham radio business, but if I were, I sure as hell would not want you as a customer, either short- or long-term.

You strike me as a prick, super-sized.

Have a good day.

You could have been a prick. And you should have told the manager
that.

You could have called them up, ordered ANOTHER rig and paid for
overnight.

Then you could have taken the first rig back to UPS, and shipped it
ground to them with an RMA and refused the first rig on your credit
card as received defective.

I've dealt with people who just don't get it, and pull 'technicalities' on
customers like this.

Then I've also dealt with companies that if it isn't right, have a
replacement
ON THE WAY immediately, at their expense.

I had an order from Everything Wireless in Florida go bad last fall when
I tried to get a GPS. Know what? Once they realized it, THEY offered
next day air, AND threw in a car kit for free.

I had UPS loose a weather station I ordered from TAPR. Know what
happened? TAPR as soon as they realized it dropped another one
to me immediately, with an email that if the first one shows up to please
send it back...

Now, you can deal with people who treat you right, or you can deal
with people who SAY they give you a deal, but then fall back and whine
if something goes wrong. Sometimes that little bit extra you pay IS
worth it. And a lot of times, you don't even have to pay that little bit
extra.

Thing is, I've heard stories about Texas Towers before, from way back
in the 1980's when I first got my ticket when I lived in Ft Worth.

Some things never change.

If you're REALLY such a good friend, why don't you print out the
original posting, take it to him, and say "HEY!! You F***ED UP on
customer service! What are you going to do about it?"

Now, his reaction may be he takes the letter, looks into it, and at
LEAST someone gets a letter of apology.

Care to do it and post here what happens?

Sorry Dennis, but if someone doesn't want to run a business that's responsible
to the customer, fine. But if someone takes my money for a service or a product, I think I'm fairly justified in expecting that I GET that service or
product.

Or is that something unreasonable?

Unfortunately, it seems that to some dealers it is. They don't want to sell. They don't want to offer service. They just want to sit on their lazy ass and be clerks that take money as you walk out the door.

I've had nothing but great experiences with Texas Towers with the exception of one case where they shipped me a microphone with the wrong connector. They do have the best prices and I'd hate to see them go out of business. You should understand that the ham radio market isn't that lucrative in the first place. The fact that they're willing to return the radio to the manufacturer for you seems to me to be very generous on their part. The defect was the manufacturer's fault, not theirs. If they wanted to, they could have just told to to deal with the manufacturer yourself. Technically, once you open the box, you own the radio and any problems it may have.

: >heartbeat. He knew that, and acted accordingly.
:
: So are you saying this dealer advertises the lowest price, takes
: an order at that price, than pegs his customers as a bunch of
: lowlifes looking for nothing but the lowest price when they have
: problems with what he sent them and ask for a bit of customer
: service? Sounds like a self-fulfilling prophesy.
:
It sounds like everyone was asking for trouble on this one. A Comm company (2-way sales-service-installations) I used to work for fully supported amateur radio because there were several hams working there, but we would always have to put on our hard hats and fire suits. We were always expected to give custom service for below the advertised basic rate, even though custom work could cost us several times more than the bread and butter commercial install. Issues like custom placement and mounts, routing of wiring and cabling, additional equipment and multiple radios and interference issues could take a 30 minute job into hours or even weeks if special orders were required.

Remember that Murphy, and the inevitable diabolical perversity of inanimate objects will always plague us. Truly TT could have handled this better, but someone shopping for price should always consider staying within the margins of an invariably limited system that allows for a tighter margin.

Remember the I Love Lucy episode with Lucy on the assembly line?

I have a McDonald's story that illustrates this concept too. I wanted extra catsup on my Big Mac at the drive through window, and they instantly shifted into special customer mode. They pointed me to a

waiting area to park my custom car and advised me that someone would assist me momentarily. Fifteen minutes later someone walked out to serve me my Big Mac with extra catsup on a tray. I didn't have the heart to tell them all I wanted was a couple extra packets!

Go into more ham stores. The majority of them are like that. They rely
mainly on the mail order biz, not joe smoe walking in the door.
As for the guy that posted the novel about his friend at Texas Towers,
I cried, beautiful work.

I have used Avvid (avvid@onramp.net 800-214-5779)
and Trinity Radio (trinityradio@compuwise.net 940-433-5452).

Although I haven't needed repair work lately, was quite satisfied with the
work done by both.

> -- Dave, WA0TTN

I think you're flat out wrong with that statement. Here in mass there's a
warrantee of what I think is called 'implied merchantability' or something.
Anyway, places can put up all the signs they want, but if it's unusable
at the time of delivery, unless it was sold 'as-is', they HAVE to take
it back.

As to mail order with a credit card, all a user has to say is it was
defective
on delivery. It just don't matter, again unless it was 'as-is' up front.

Texas Towers is selling merchandise that is implied to be new in the box
and usable upon receipt. Hey, it's not their fault if someone gets
something
bad from a manufacturer.

But it SURE AS HELL IS THEIR RESPONSIBILITY.

Should the customer take care of the problem? Why should he? HE
didn't make a profit on selling the item, the SELLER did. If the seller
claims he won't make money, as one person alluded, I'd have to ask,
is he THAT STUPID to be in the business? Come on here. Your
attitude that it's the buyers responsibility is BULL DROPPINGS!

If YOU are in a retail business with this attitude I sure as hell don't
want to do ANY kind of business with your store!.

Mike

I'm about 200 miles from the place, will be in there sometime in the
next two months! However the post was not to expand on what and if and
so on, only to show how difficult it is make things work - all the time.

However, for either of us to take the time to hash it all out between
us, is going to be yet another X bucks worth of time for both of us,
which, might get an answer posted here in a couple of months..

I doubt that would really be useful.

I understand both sides of the issue.

In one business in which I'm a principal, but a non-control one, the
controlling principal's desk has a collection of bad checks in it
totally over $125,000 US in the stack. These were all accumulated over
some 20 years or so, and include instruments from probably 20 different
states. And that has nothing to do with the myriad of paper schemes
and whatever which go back and forth to get someone a 'better deal',
when it really ought not to be.

From experience, it has taken us probably $2,000,000 just to cover that
loss above. And the pile includes everything from just plain checks, to
Cashier's Checks, and even to bank paper which blew up when the bank
folded between the time we took it and the thing hit!

If I were to take it to Gerald, I'd likely find that there is a
personality difference between the people which is the focal point. Our
research at the same origanization above indicates that over 75% of all
these sort of things are really driven by personality clashes one way or
another. Even if I got an answer for you, it would be difficult to
convey all the meaning and the emotions.

In order to share a value judgment, each party must have some experience in common to do so. That's often very hard to do in cases like this. I posted my reply to try to create that common link, no more; no less.

I would agree that Texas Towers has the best prices, but who wants to wait a week or two for a back order. I called about a Yaesu FT-1000MP Mk V ($2498 plus $25 shipping) great deal From Texas Towers. ($2549 shipped) from AES. I got it 2 days later from AES. I paid $24 more, but I didn't have to wait.

A brilliant man I used to work with passed away and his widow had an estate sale. I bought this glass tube on a porcelain base/socket with 4 screw/nut connectors.

There is a rod connection coming out the top of the tube and a 3/8" round connector coming out the side near the bottom at an angle.

in a rectangular border on the side of the glass (about 3-1/2" diameter, 7-1/2" tall on socket):
EIMAC
Reg U.S. Pat. Off.
VT129/304TL
MADE IN U.S.A.
Des. Pat. No. 127758
Des. Pat. No. 135792

What the heck is it?

Since TT sent a defective product they should bear all expense for
making it right, even if it means they do not make a profit on
this one. I knew the owner of TT when it first began in business
years ago and the owner was never known for treating customers
with courtesy. Don't know if it is still under the same ownership
but what happened to this customer was not uncommon.

OK, everyone is entitled to make a profit, but when you screw up
with the customer, forget the profit and make things right, it's
called customer service. And by the way, I have seen Geralds's
very negative side with customers many times.

So I guess everyone who buys for him is pegged as a buyer shopping for price....amazing! Do you think that is why he offers a lower price? To get customers to purchase from him maybe? Isn't that something called competition? When a defective product is delivered, the supplier should make it right at no further expense to the customer, profit or no profit.

Hi Guys;
I have for sale this nice SBE-33 transceiver. Brought it up on a variac, was'nt used in years. The cabinet was discolored so I compounded it, looks much better.
There are 2 mods, one is a Headphone jack in front, nicely done.
The other is a tiny neon light in the back, its on when the rig is plugged in, why? who knows?
There are 4 rubber bumpers on the side so you can stand it on end during transport.
I get about 60 to 40 watts out depending on band, all seems to work, used Drake mike plug & wiring, ssb works also, receives well.
Uses Collins Mechanical Filter. I have the Alignment instructions & schematic.
While it works & looks nice, I cannot guaranteee the alignment but you can certainly make contact as it is!
Oh, all plug in transistors for receiver, 3 tubes in the Rf.
Check these pics, nicely made inside!

On item #2, realize the costs of shipping are more than just what UPS, etc. charge. Packing materials, labor, paperwork, etc., are also shipping costs.

I agree some places do get carried away with shipping/handling charges, but don't ask them to ship just for the UPS/FedEx fee.

6359. Broadband Tank Circuit Question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-23 15:32:26 UTC
From: Ron H <123456@mediaone.net>
Message-ID: <e_tL7.1768$fN3.181516@typhoon.mn.mediaone.net>
Source record: 51565
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,sci.electronics.design

I am gathering info to build an HF amplifier but have not been able to find a good design for a truly braodband tank circuit. I know that the amp will always be used with a tuner so it makes sense to make the amps output fixed at 50 ohms or close to that over the full range of each band. I suppose a resistor would do but then there would be the power considerations.

Tnx
K3PID

Hello out there

I brushed the dust off my FT-530 today after it sitting idle for 3
years.. and completely forgot how to program frequencies into thie
radio.

I need help programming a frequency, saving it, and setting and
saving PL Tones for a frequency
The repeater offset is still programed into the radio at .60 MHz

Could someone also tell me how to lockout certain memory locations so
that are passed over when the scanner is in scan mode, and how to get
the radio into scan mode

Thanks

Its a triode with a plate dissipation rating of 304 Watts. If you look at the side connector
I think you will find that there is a heat sink fastened to a "rod". This is the grid connection.
The "rod" on the top is the plate connection. I don't remember the filament voltage and
current, but I do remember that the filament required quite a bit of power. This tube was
made bu putting four 75TL assemblies in one envelope.

>From: Jeff Pierce:....."then an auto dealer can tell you to ship your car back
to
>Detroit/Japan to fix any manufacturing defects, at your cost. Or, you......."

What gets me is the Twisted logic people like You come up with in this topic...For example, the Posts that are defening this guy all have the need to imply that Texas Towers was Not offering any customer service, when in fact they said, "No problem, we'll get you out another rig", no questions asked, as soon as he called. He Was NEVER told to send the Radio to Icom.
Also, your "Car" comparision is invalid, & would be more correct as follows:
" A guy has a problem with the new car he bought, & returns to the service dept, where the guy says, "no problem, We will need to keep the auto, it will be ready late tomorrow."
The Car buyer then says to the manager, "Hey, I paid extra for the salesman to expidite the paperwork, & it originally only took me 12 minutes to come in, sign the papers & leave with the car, I WANT you to have my Car fixed within 12 minutes, Even if you have to Stop every worker & salesman in the place, & put him on my car, at your expense..., He then goes home & tries to convince people on the car Newsgroup how "unreasonable" that dealership is....."
That would be closer/more evqivelent to this situation......
I also took some time out to call some of the #800 numbers in CQ Magazine with the question " If I pay for overnight air & get a defect, Will you overnight me a replacement".....A couple of them said defects should be directed to the mfgr, the rest ALL said , in their own words, that overnight air is an Extra service that would have to be paid for, otherwise regular shiiping on the return was free, & also ALL of them said it is my expense to ship/get the item back to them.....The only way to defend this guy is to use standards that almost No dealer will meet, (call other dealers yourself), & then also claim Texas Towers didn't offer the customer services that they actually did.....

Depends a BUNCH on your definition of repeater.
I've used two handhelds on 440 with 5mhz split, seperate rubber duckie antennas to get short range links to a remote base (100 feet). Just attenuate the audio out from one and stick it into the microphone of the other. Need a way to key the transmitter. Can pull a signal out of the handheld or use a photodetector
on the light that comes on when the squelch breaks.

And make sure you're always around to verbally ID it every ten minutes.
Unless you're in the boonies, there probably aren't any available frequency pairs,

so be prepared to deal with the people who are coordinated that you're interfering with.
You'll want to listen on the ouput frequency so you can inhibit the transmitter if it's in use.

If you want a REAL unattended repeater that is reliable and has
useful sensitivity, you've got more issues than you can shake a stick at.

Email me if you want to chat about it. I've been looking for an excuse to take a pair
of u12 handhelds and a PIC processor....

There's a mobile duplexer for sale at the link in the sig.

You need to know the complex output impedance of the amplifier across
each band and then devise a circuit that best matches it to 50 Ohms.
Alternatively you can just get it closer to 50 Ohms, and rely on the
tuner to do the rest. Keep the coax run between the amplifier and tuner
as short as possible if you want to maximize the bandwidth.

Everyone has differing opinions on this I am sure. For what it is worth, this is mine.....
I have ordered from R & L Electronics often, sometimes the best price, often not, but the customer service at R & L is very much like your hometown shop down the street where people seem to remember your name and actually care about your buying experience.

Not dissimilar, I have dealt with AES often too. They have a much larger selection of parts and accessories than R & L and are a much bigger operation, not quite as "hometown" like but they still seem to care about your satisfaction.

To date, I have made several purchases from Texas Towers, I have not had the "hometown" experience with them, but they have always honored what they sold, and yes, they often have the best price around.

HRO, they are a hometown dealer of sorts for me. They have a location less than two hours away that I have often visited and I have ordered from them by mail as well. To me, they act like they could care less if I bought anything from them or not. When in their store in person, they have three clerks just hanging around doing nothing and do not try and help out at all. They may honor their warranty but I will not buy from them under any circumstances anymore... and by the way.... I have a lot of friends that have had a similiar experience. If they have a product for $20.00 less I promise you I will pay the extra $20 somewhere else or do without.

Sincerely,

Patrick de W4PHM

6368. For Sale: GE Master II VHF, 110 watt

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-23 19:41:44 UTC
From: Bill Abate <wabate@dandy.net>
Message-ID: <si9tvtciu5jtp78juv35178jqbe8ond3i1@4ax.com>
Source record: 51572

For Sale:
GE Master II VHF. This is the 110 watt unit with adjustable output. It has already been aligned to 2 meters. At present it is on 145.01 simplex for packet use. I have a second one that is currently on 145.05. Both units are fully functional. No excuses here: won't say I don't know how to turn it on; won't say a third party told me it worked fine two decades ago! I have used these units for years. Guaranteed not DOA.

The units come complete. They have the control head, speaker, mounting plate, microphone, power cables and interconnecting cable. I installed a single stage jfet preamp that makes the receiver hot. Its a simple thing to pull out if you prefer. I have the original channel guard that came with the unit. The mother board is bypassed but you can reinstall it if you want. All of this is included. The price is $95 EACH plus shipping from 19001.

I have pictures for those interested in buying.

73,

Bill, K3PGB

From: vtail@hotmail.com
Message-ID: <3bfeac15.11457274@news.netis.com>
Source record: 51574

There are 2 repeaters in the Boston area I'd like to be able to use, but even after raising my antenna another 15 feet I can't quite hear them reliably very much of the time.

I'm told I can hit them OK, but on receive, one is marginal and the other is barely readable, much of the time.

I've seen some of those outboard receive preamps, designed for use with transceivers, that automatically kick themselves out of the way when they detect a transmitted carrier. Do any of you have experience with any of these and do they improve reception enough to be worth it?

Thanks...

Rick

I've own one since Dayton. I went for it because of good imd spec and the price was good. The only thing I don't like is the control knobs feel cheap. The tuning knob shaft was catching the face plate. I scrape it and put dab of lithium grease on it. The only other issue is when running high power the rig gets very hot. Since the rig is convection cooled, you need to keep it out in the open.

I haven't tried the software yet. I still need to buy the interface cable for it. I have to remember to try the outband receive.
Overall Its good rig for base or mobile. So I highly recommend it.

A more to the point, and fairer comparision, would be asking the dealer to pay for your gas money when bringing in a new car for a warranty problem. Not very likely to happen.

6379. Questions about SANGEAN 606A

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-23 23:42:58 UTC
From: info@eastway.de
Message-ID: <81b438ef.0111231542.680e88b4@posting.google.com>
Source record: 51582

hello everybody,

as a novice to short wave radio i would like to know, how does perform a sangean 606A portable receiver compared to other portables of this size. myself, i have done side by side test with an old analogue sony IFC-7601 (built 1989) and did not found any significant differences, apart from sangean being apparently able to filter out some annoining "noises" on sw, which sony did not. sensivity of both radios was about the same.

now to my questions:

1. could be it be that also the much more costly portable receivers would not be any better, apart from more or less cosmetic add ons ? for example: sync lock may be nice, but i bet there is no such thing like a weak signal you could not receive because you have not get sync lock on your receiver...

2. why is that sangean 606A does have an external antenna socket ? i have run many test with selfmade wire antennas of different sizes and arrangments (grounded or not) and was not able to get better results that those with the built in telescopic antenna. is it intended only for the original sangean wire antenna ? in case you have got such an antenna: what diameter has the wire and what is the construction principle of this antenna (i.e. folded dipol ?).

i would be also very geratfull for any other hints and tips concerning sangean 606A portable.

No such thing as a "broad band tank circuit" A tank circuit implies energy
storage
such as used with a class C amplifier. As such it is narrow band. Other types
of amplifier operation can be coupled with a matching circuit and maybe a low
pass
filter.

What type of amplifier are you planning?

You didn't mention if it's a solid state amp or a vacuum tube one.
For solid state, have a look at the work Helge Granberg (sp??) did
while at Motorola (Lots of ap notes!)...or see any number of other
references. For a vacuum-tube amp, if you use a tuned tank, you're
stuck with some minimum Q; but if you put a broadband transformer in
the circuit, you could get to rather a lower Q. Mind you, you may not
really WANT all that low a Q! Depends on what you're trying to
accomplish. But you could put in a 9:1 or even 16:1 broadband
transformer and have to match a much lower impedance ratio. I'd for
sure put the transformer at the output of the tuned tank. Do you have
any reference books to help you out? BTW, the old Central Electronics
rigs used cathode-follower outputs, as I recall, for broadband output.

Cheers,
Tom

I ordered a new 7100 from them and got a used one, that is one that was broke and had been sent to the factory. Called and they shipped a new one but said the would hold the ticket until they received the used one. Turns out they did charge my card and I had to call to have it took off. The new one they sent worked two weeks and went dead. I called and was told to send it to the Factory. No more for me at Texas Towers .

New cond'x Icom IC-2GXAT, 2m handi. Heavy duty radio with mil-spec for
shock and water resistance. Comes with these accessories:
2 aftermarket rubber ducks: Comet SH-55 2m/440 and Diamond RH77CA 2m/440
1 mag mount antenna: Valor 2m/440 mini mag mount
car window mount for any antenna with BNC connector
2 BP 160 nicad battery packs
1 BP 130A alkaline battery case
1 CP-13L DC car adapter
1 AD-25 charger adapter for external battery charging
desktop charger
Realistic speaker mic

The radio is one owner, perfect operating and physical cond'x, comes
with manual and box. I will ship. Asking $150 US or $250 Cdn.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

One Motorola NASCAR style headset w/ boom mic and VOX unit.
Headset Model HMN9022A, unknown model on the VOX but it is a small beltclip using a AAA battery, with thumb PTT on top and ptt/vox switch on the side. Headset and VOX appear new but I believe they have been used. No scratches, no dents no roughness. Plastic still satin finish as new. There is one small problem: the tiny catch on the battery door of the vox unit has been bent back and cracked, therefore the battery door will come off too easily. This is perhaps a $2.00 part (if that). The headset is flawless.
Plugs directly into SP10, SP50, GP300, GP350 (adapter) or any radio with similar dual plug.
Both items current Moto products, go check them out for specs!

Priced at $160 Shipped CONUS
thanks!

Actually, the logic you use below is just as flawed.

> Also, your "Car" comparision is invalid, & would be more correct as
follows:
> " A guy has a problem with the new car he bought, & returns to the
service
> dept, where the guy says, "no problem, We will need to keep the auto, it
will
> be ready late tomorrow."
> The Car buyer then says to the manager, "Hey, I paid extra for the
salesman
> to expidite the paperwork, & it originally only took me 12 minutes to come
in,
> sign the papers & leave with the car, I WANT you to have my Car fixed
within 12
> minutes, Even if you have to Stop every worker & salesman in the place, &
put
> him on my car, at your expense..., He then goes home & tries to convince
people
> on the car Newsgroup how "unreasonable" that dealership is....."
> That would be closer/more evqivelent to this situation......

A more accurate comparison would be, you buy a car and pay extra to expedite the sale, such as somebody from the dealership working late to prepare the title. When you arrive to pickup the car, the salesman tells you, "I'm sorry, the car you bought broke down, we are going to have to put it in the shop, and you won't be able to drive it until tomorrow or later. If you want another car, we can have one ready for you, same color and features, but we won't be able to have it until tomorrow, either, and the title will have to be mailed to you." When you say "But I paid extra to have everything ready tonight!", the salesman replies "But that was on the first car, this is a different car, if you want special handling, you have to pay

extra again." At that point, you would certainly be justified in picking up your cash and walking out, the dealership has violated the terms of the sale. (I used to work in a GM dealership as a Parts Manager, and have some knowledge of these situations.)

Now, if you take delivery of the vehicle in good, working order and it breaks down AFTER you have used it, then you have to accept warranty service, even if it takes longer than you'd like. And believe me, new car owners can get very pissed off when told their car has to stay in the shop overnight, generally waiting on parts.

In this case, the radio was not delivered in good working order, so the buyer has every right to expect the seller to make things right as quickly as possible. The radio was defective BEFORE shipping, which is not the buyer's fault. In respect to my analogy above, I remember at least one case where a brand-new customer-ordered car that just came off the transport was defective (the rear end was out, we had to pull it off the tranport with a wrecker). The dealership located a car at another dealership that was the same as the factory-defective unit we received. My dealer bought the car from the other dealer and sent a driver to to bring it back, all to keep a customer happy. It cost more to buy and transfer the replacement car than the dealer made on the sale, but that's what it took to keep his word to the customer.

That's what you call customer service.

Mark

When you say "But I paid extra to have everything ready tonight!, salesman replies, "that was on the first car, ..if you want you will have to pay the special handling again".....<snip>
-*-*This is very off base w/ the situation.
1 - It ASSumes that the dealer checked & was Aware Of The Defect before Delivering it to the customer, & never actually delivered ANY Product to the customer.
2 -Yet, your analogy also ASSumes that the Dealer is keeping the overnight delivery charge anyway, even After telling the customer he can't deliver anything, & then asks for Double delivery charge to get just 1 item to the customer. In the Texass Twr case, There is no reason to believe that the salesman opened up & tested the unit & found it to be defective, &he did ship the item overnight as promised.
Your Invalid analogy would apply if Texas towers called the customer back an hour after he ordered the radio & said, "Mr. Smith, we discovered that the '706 we were going to send you is broken. It will take us a few days to get another, but we are going to keep your overnight air money on the one we aren't going to ship you, & charge you overnight air Again on the 1 and only unit we eventually ship you....This is NOT what happened.....

Hi,

I am looking for some traps to build a multi-band (40M,80M,160M) dipole/
inverted V antenna.

Here's the wish list:

A pair of 40M traps

A pair of 80M traps.

Let me know what you got and what you want for them.

Thanks,
Bill

I picked up a set of Drake twins, the R-4C and T-4XC.

Out of the sake of curiosity, on the average, what did these radios cost when they were originally sold in the '70's.

Thanks.

Mark, KE6OI

Radio Shack sells a transformer that will match several impedences on the input and output side. It is called a line transformer (used in PA systems). I use one to match my 600-ohm output from my R390A to a 4-ohm speaker. Actually, I think it's only 500-ohms, but it's close enough. Works fine and is relatively inexpensive.

There is a much better quality transformer designed exactly for your application. It is sold through Antique Electronic Supply. A bit pricier than the R.S. model, but is supposed to be a much better transformer. It matches exactly to 600-ohms.

Your choice.

Message-ID: <c651acdc.0111241449.3ae2f22@posting.google.com>
Source record: 51511

Hi All,

I'm a engineer for a small manufacturing operation that has been trying to breath some life into the company's two way radio system. This system was orginally set up by a ham that worked for us and retired (now unavailable to help due to health problems).

Anyhow, we had a very old base/portable configuration until the last year or so. I've replaced all of the older rock portables with synth MT1000's and HT600's that seem to work great... thanks to all of your help.

This company also ran a repeater at one time, but through the last 5-7 years it went into disuse and has disappeared. I have, with suggestions from the group, successfully modified 2 Radius 25 watt mobiles to use as a new repeater base system, along with a CES-RM20 plus controller. I have one antenna and was planning on using a Phelps-Dodge/Celwave mobile duplexer model 635-509 D6A. These radios are in the VHF 151.xxx - range and the old repeater was on 151.xxx / 153.xxx.

The repeater's use is merely to extend HT range thoughout our plant complex of 9+ acres which includes a bunch of conveyors, equipment and the like. While the portables do well, they don't provide end-to-end coverage.

I don't have a lot of budget on this project so I've kinda pieced things together as an interesting challenge. However, the equipment necessary in tuning this duplexer is not available to me.

So, my question is this... do I find someone to tune this duplexer or try and install a second antenna with a small vertical separation (say 5')? The base antenna is not tower mounted but affixed to a central roof location on a short mast. What's more cost effective for my purpose? I'm not looking to utilize the radios for miles and miles... just a good clear signal from property line to property line.

Any help would be greatly appreciated... Thanks,

John

P.S. I've got some of the older rocks left (HT-500's and Expos) that I might consider trading for tuning help. I know they're worth more than a simple tune job (probably (-:) but maybe we could work something out on that or another antenna if that's the way to go. I know a couple of the Expos and at least one of the -500's was working when taken out of service with fairly new bats installed. I think one of

the -500's even has a speaker mic. I also have a 6 bay gang charger
for the Expo's... I think it's still around!!!

I have a Kenwood TH22AT ht that I use infrequently, but I always keep it in the charger and charge it periodically. I pulled it out of the charger the other day and it's dead as a door nail. I've had the radio for about 5 years. Will the ni-cad battery packs crap out over time from being kept in the charger? Never had any problem with the radio and was surprized to find it dead. My volt meter is at work so I havn't had a chance to check to see if the battery has any juice. Any thoughts? Tnx in advance.

6412. Kenwood TH-77A Transmit Failure

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-25 00:49:39 UTC
From: DAVE INGRAM <s002082@student.uq.edu.au>

Hi,

After having my Kenwood TH-77A (Australasian version) in the cupboard for sometime I decided to make sure all was working OK. To my horror the transmit 'feature' is no longer there.

The radio receives fine on VHF,UHF and VUHF (the pushed VHF). There is some warmth I think when it tried initially but now the 'on air' symbol appears in the LCD but the transmit bars do not show. I have disassembled it completely and there is no break on the feed to the antenna (used to happen with my old TH27).

The radio was modded before I purchased it second hand so it has wideband VHF Tx/Rx and UHF widened as well. The mods look like they should enable airband AM but this doesn't work (so any hints about that would be good).

If anyone has had their Kenwood TH-77 stop transmitting and fixed it I would appreciate their comments. The radio is not worth taking to a repair shop especially if it was going to cost more than A$100 to look at it. Plenty of new micro handhelds available and the old one can be used as a receiver.

I look forward to any comments and appreciate your help.

Cheers,
Dave.
ZL3TDI.

NiCads have a service life, and after five years yours may have reached it. Also, continually charging a NiCad without ever using it will also lead to premature failure. The cells often short, and the battery will not take a charge. Some hams have luck "zapping" dead NiCads back to life by briefly (1 second or less) applying 12 VDC to the pack to burn away internal shorts--IMHO this a very risky operation.

A broadband tank circuit is the antithis of what you find in an amplifier.
Tank circuits are high Q = narrow band, but you can add presets to cover the
bands in steps. Moving in frequency requires retunning to put the impedance
back where it belongs.

Unbuilt Heathkit Wind Speed Weather Station - Ebay

This is a digital wind speed and wind direction indicator, Model ID-1590.
It measures wind speed to 99 mph, and shows wind direction with 16 points of
resolution.

The kit is unassembled. It was originally purchased in 1984. I purchased
it from the original owner, who opened the box, and confirmed that all of
the parts were present (he checked the locations designated in the manual to
indicate as such). Since the box was opened, I checked each part against
the parts list, and confirmed that all parts are present, in new condition.

For auction on Ebay, click on:

Most of the military "LS" speakers have such a transformer in them and they, obviously, work very well. Fair Radio is a source of them and/or good 'ol E-pay. There is a trick of using a small 6.3 filament transformer. I'm not sure of the exact impedance of these but I've done it for years. This was a very popular method around the time I first got into ham radio and used surplus equipment in the late 50's.

Hmm... I've been looking for a good-n-cheap first-time HF rig, and... I got an email from a guy offering to sell me his "like new" 817 for $450...
So.. Does it actually work as advertised? ;) Is 5watts enough to reliably communicate with my neighbors within a 30mile area?...
Thanks.
PS. I also like the idea of being able to easily take it in the car, camping, etc.. so there would be some advantages to the portability part of it for me.

There's always going to be bad experiences like that with any business. I
disagree that the bad always outweights the good.

Hi! I wouldn't recommend that rig as a first time rig. If you are not an experienced operator you will definetely find 5 watts a bit frustrating. If you want a good, inexpensive first time rig try something like an ICOM 735, they are built to last, have all the features you need and have a great receiver in them. Then when you get some experience build yourself one of the many little QRP transceiver kits out there and then have fun with QRP (low power operation).

No, actually, the only assumption I made was that the person selling the product was interested in keeping his customer satisfied. All I did was correct the previous erroneous analogies in regards to car sales. My point was (and still is): sometimes the seller has to sacrifice profit for customer satisfaction. The seller has an ethical obligation to deliver a working product, regardless of what he is legally required to do. As for opening or not opening the box prior to shipment, I don't see where the seller was an obligation to deliver a factory-sealed box. (In fact, both radios I ordered this last year came in unsealed boxes from the factory.) How about this for an idea? You order a new radio from ABC Radio Sales. When you receive it, attached to the opened and resealed carton is a printed note from ABC saying "We have inspected this radio prior to shipment to insure that it is undamaged and that all accessories are included. If there are any problems please contact us at 1-800-555-1234 and have this form and your invoice handy." This form would be signed by the person making the inspection. I would be happy to see such a notice in any order I received, as it would tell me the seller cares about my satisfaction.

To those that say the profit margin is too low to allow the extra service, what kind of profit margin is there in the lost sales as a result of this incident. Something else I learned while working at the car dealership: A satisfied customer can bring you three additional sales, a dissatisfied customer will cost you ten sales due to the negative comments made to others. How many people who read this NG will think twice before ordering from Texas Towers. I can say that due to previous negative comments from dissatisfied customers, I didn't even consider TT when I purchased two radios (total $750) this last year. There's two lost sales right there.

The large battery pack in my TH79 lasted even less time. I found another supplier that was considerably less expensive than Kenwood (kendoo.com I believe) and got an identical pack, mainly because I already had the dual drop-in charger.

However, since I use the HT very infrequently as well, when this battery dies I will buy a NiMH battery pack and a charger to go with it and end all this foolishness. 20-20 hindsight told me a week after getting the 2nd NiCd that I should have gone NiMH.

I find those comments very interesting. I HAD an SG2020 and thought it was great for SSB, it is a terrible CW rig. Service from SGC is very poor IMHO.

But as for QRP, you do not have to be "experienced" to use QRP. I have used the FT-817 very successfully with a ground mounted Butternut vertical and also with a random wire and a Z11 autotuner. There is really nothing to it. Even during contests I manage to make contacts fairly easy. It is a great versatile radio and Yaesu provides good service compared to SGC.

6449. Re: Experience with Texas Towers

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-25 16:51:37 UTC
From: rsmtmn@aol.com
Message-ID: <20011125115137.27443.00001433@mb-cl.aol.com>
Source record: 51402

I had somewhat of a similar experience with Texas Towers when I purchased a Rohn 25G Tower from them. They told me that it would have to be shipped by truck, and that it would be delivered to my doorstep. 7 days later I get a letter from a shipping company an hour and a half away telling me that the Rohn Tower is there, and to come pick it up. I told them that they are supposed to deliever it to my house. They said "nope", come get it. I called Texas Towers and they refused to do anything about it and proceeded to tell me how the Trucking Companies are run by the mob and etc.... So, I made the hour and a half trip, picked up the tower and will never again do business with Texas Towers. The response from Texas Towers when I told them I wouldn't do business with them..."Thats fine!!".
I realize that the business is cut-throat for profits, but just the tone of their customer service is just plain nasty, and I refuse to do further business with them.

I understand Rohn makes 8-foot 25G sections that can be shipped
by UPS, just to avoid this sort of problem with trucking costs, etc.
The 8 footers don't seem to be a popular item with most distributors,
however. As info, FWIW.

Not on hf, on ssb -- not *reliably*.

On hf bands, on ssb, 5 watts is roughing it, especially if you have a marginal antenna. For $450, I'd look at a used 100 watts-output rig. Or spend another $120 or so (see texastowers.com) and get something like a new Icom 718.

On the other hand, if you enjoy CW, 5 watts will be comparable to 100 watts on ssb.

Hello Brent,
I would suggest you take a look at the W9INN MPD-5C dipole. It has resonance on 10-15-20-40-80m and comes in either 78ft length or 87 ft length. The longer version has a bit more bandwidth on the lower bands. It is rated for 1500w pep and comes assembled and pre-tuned to your specs. I have had the 78ft version up at 54ft for over 5 years with no trouble and 299 DXCC countries to boot....it works well.

The official W9INN page is at the web site listed below. There are illustrations, real-world measured bandwidth data and contact info.

I'm sorry to hear the problems with TT. Owner Gerald Williamson has always treated me super, though I haven't seen or talked with him in several years. He always took time to chat.

His son, Matt, who may be running it now, does NOT have his father's "bedside manner." He can be abrupt and sound like he doesn't much care, but he has always taken good care of my orders and me in person. I'm sure employees will tend to reflect the attitude of management. It is a very tough business with little-to-no profit and hams tend to be some of the tightest, most difficult buyers in retailing. They probably run short-handed and over-worked. Unfortunately, the overall impression is that they would rather be somewhere else, doing something else... If I were in their shoes, that would probably be true for me. A long time ago, I spent 15 years in that business. I would have to be starving to do it again. My hat is off to those in the business who are able to retain an interested, caring attitude.

6465. Need external PL / CTCSS tone generator for old 2MFM rig

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-25 19:25:01 UTC
From: vtail@hotmail.com
Message-ID: <3c0144fc.29332082@news.netis.com>
Source record: 51419

I need a way to add PL / CTCSS tones to a 2 meter FM transceiver that never came equipped wtih them.

Preferably it needs to have all standard PL tones available, not just a selection among a few.

Is there an aftermarket tone generator, perhaps something that connects between the microphone and the radio's microphone connector, that will do the trick?

Thanks...

> So.. Does it actually work as advertised? ;)

You can get a LOT of information by checking out these two Yahoo Groups, which have hundreds of 817 owners giving their opinions of the rig. You'll find they are very happy.

http://groups.yahoo.com/group/FT817
http://groups.yahoo.com/group/hfpack

You'll see that guys are getting lots of DX, even on sideband, using the 817 and commercially available portable antennas like the MP1 and Outbacker Joey. A random wire and a Z-11 tuner will do nicely, too. Forget what these other guys are saying about QRP being an art. The whole point of the 817, and the manufacturers who are making accessories for it, is to make QRP easy for everyone.

I'm thinking about getting either an 817 or a FT-100D as my primary HF rig. Right now, I have a 25W 10m rig, which I am going to dump to buy something with more bands and modes. I find that the ONLY time I am interested in running my radio is when I am away camping, on field day, or out at the park. If I'm at home, I've got better things to do than play with radios.So I need a rig that moves around easily. For just a couple hundred bucks more, the FT-100D is a much better rig, but the way it uses up power is a huge negative for me.

The advantage of the 817 is that it runs on very little power. If you want to get out of the house with a radio, the 817 is a dream machine. You won't have to tote around a freaking car battery with you. It's also a great VHF/UHF rig, that lets you use more modes than a typical HT. And it has a decent wideband receiver, if you like just listening to SW broadcasts.

Guys who talk down about the 817 often have a bias because they are interested in contesting, or hunting rare DX, or spend many hours each week on the radio. For that, it's a bad radio, and they are right about not getting the 817 as your first HF rig. If you are like me, and have more interesting things to do than contesting, and just want to talk with friends occasionaly, or have a nice portable emergency communications rig, then the 817 makes a nice machine.

Check out those yahoo groups and learn more. Good luck.

Communications Specialists make these. They come in various configurations. From small circuit boards with solder traces, to larger versions with DIP switches, and there is one version, that is an external box and you can dial up whatever you want. The small circuit boards let you access only one tone at a time. If you wish to change tones, then you have to reprogram the board, which is usually mounted in the radio. FWIW, these boards usually connect to +12v, Ground, and center of the deviation control. Not between the mike and the transmitter. Check with AES. I know they are a dealer for Comm Spec.

I am seeing a lot of bad advice (or at least advice I do not agree with) being posted in response to your question.

Many of the comments miss the point.

5 watts is excellent for daytime NVIS (straight up, reflected back down) communications on 40 meters using low antennas. A horizontal dipole up 10 or 15 feet is excellent. We meet daily in Hawaii at 4pm and communicate all over the state in spite of the mountains. Range is to about 300 miles. Good signals everywhere. When 40 meters is not working at night then 80 takes over. Sometimes, late night, even 80 quits and 160 can be used. The key to low power usage is flexibility.

The 817 would be an almost ideal backpack radio except that it is definitely NOT optimized for low power operation. It kills AA Alkaline batteries in just a short time on receive only. I think it draws 300 or 400 mils in receive mode. There may be a big variation between radios. I ran into one fellow at Pacificon that was only getting about 2 hours. This is definitely not low power receive. If you use rechargeable NiCad or NIMH with a 6x10 inch flexible solar panel on your backpack you might be happy. You will also want a small antenna tuner.

With these restrictions, I believe the 817 hits the spot, including 2 meter repeaters.

Be the way, I do not have one. I have a Elecraft K2 (built from a kit with great instructions and factory support) which is a far better HF radio but is not as back pack friendly as the bare 817. But it does include a great internal tuner and battery sufficient for about 8 hours of operation including a reasonable amount of transmit time. The receiver is second to none including the big FT1000 etc. It does not include the VHF capability.

The 817 begins to look a lot more like the size and weight of the K2 when a tuner and extra battery capacity are included.

The SGC (in my opinion) is not in the running except that it is perhaps cheaper. And it does work on SSB. So it represents a different tradeoff.

Good luck,
John KH7T

Curious, are you talking about CW or SSB? I hear plenty of regional SSB rag-chewing on 40 in the day, and 80 at night. Most everyone is running 100 watts plus an amplifier to a full-size dipole. Otherwise, you just cannot be heard over the noise and static, especially in the summer.

CW might be a different deal, and Hawaii might be quieter in regard to atmospherics.

From: davearea51@aol.com
Message-ID: <20011125174008.04766.00001710@mb-mc.aol.com>
Source record: 51427

Amplifier or RF deck I can dedicate to 160-meters. Need not have the power supply, but if it does, so much the better. I am a home brewer, so have NO NEED for the Alphas, AL-1500's, Clipperton L's, and the like - don't bother. If it needs "fixing", so much the better! I will DEDICATE it to one and only one band: 1.8 to 2.0 MHz. MUST also have adequate dissipation to operate AM with reserve (4 X 572B's will NOT do the job). Please reply by email to either:
DaveArea51@aol.com or W0LEV@ARRL.net
Thanks for reading.

The '817 is, bar NONE, the most fun radio I have ever owned. It has its limitations as a primary radio, but can't be beat for "everything in one box"! Try it. You'll be sorry if you don't, especially for $450!

Dave - W0LEV

Bob
k5qwg>

I am talking about SSB. Our daily net uses 50 and 100 watt signals and usually achieves S8 to S9+10 signals. The noise level is usually less than S5 at my station. My receiver is calibrated to approximately 5dB per S unit.

So we usually have 20 to 30 db margin to the noise level with 50 watts. The 5 to 10 watt PEP stations are usually heard with a few dB margin. Tests often run down to under a watt before intelligibility is lost. One could argue that the 100 watt station is running illegal excess power. HI HI

The 5 watt signal may not be easily copyable by all stations but often is. The original station did talk about range up to 30 miles and not the 300 I referred to.

Unfortunately, many of the participating stations use vertical antennas and lose many db compared to the NVIS low horizontal. So I agree that 5O to 100 watts seems necessary to many. The high dipole optimized for longer range may also not be as effective as the lower dipole that has a larger high angle or vertical lobe.

Local thunder storms could be a problem but non-local atmospheric noise is also worse when the low angle of radiation vertical DX antenna is used. The "better" high dipole also picks up more noise in the distance. And I do not want to be on the air on a mountain top during a local thunderstorm.

Aloha,
John KH7T

I've got a Vertex VX-150 with both the NiCd (stock) battery and the
accessory 'AA' battery holder full of NiMH batteries. On a normal run of
the radio the stock battery will run 8 hours +/- and the NiMH's will do 24
to 30 hours under the same use. Needless to say the stock battery is now
only used as a "Back Up" battery :)

Now I'm wondering why all HT's don't come with NiMH or Lithium Ion batteries?

Tube type power transformers - NEW.

1) Brescia 10V CT at 10 Amps with 115V / 230V Primary
Will sell for $18.00

2) Raytheon TF15X02YY with 120V Primary.
Secondary is 1100V CT at 180 mA continuous.
Dimensions: 3" X 5.25" X 6.5" tall.
Potted, encased case with four mounting studs.
Will sell for $38.00 plus shipping

3) ADC Co. (AVCO-Crosley) model TF4SX03KA
Has 120V AC primary and two secondaries.
Sec A: 1050 V CT at 75 mA continuous
Sec B: 5V at 20 A continuous.
Will sell for $27.00 plus shipping

4) Also have a great filament transformer for that BIG final
amplifier:
115V / 230V primary.
Secondary is 7.5V CT at 51 Amps.
Brand new. Will sell for $95.00 plus shipping

To all who might like to help;

I thought it might be interesting for my son to do a project on amateur radio for his grade 4/5 geography class. What I am looking for are cards from hams in various states or countries that show some special landmark that their area is known for. Example..A French ham with the Eiffel Tower on his card, or a ham from South Dakota with Mt. Rushmore on his. I also hope this may introduce ham radio to his classmates. Yes I understand there are mailing costs involved and I don't expect everyone to help out. But for those who don't mind dropping a card in the mail, it would be greatly appreciated. My son has expressed an interest in studying for the test for some time now, and I thought this would be a great way to show his classmates parts of the world they might never see, and also introduce them to ham radio at the same time. Please feel free to e-mail me if you have any questions.

My address is good in the callbook. I do not use the bureau.

Thank you,

Max VE3TMT

The VX-5 is a nice radio.

I sold mine and went with the Kenwood TH-6, though. 6 meter contacts never happened- even though I could hear the repearter I could rarely hit it. Intermod made the radio occasionally unusable (on 440 ONLY, though that is my primary band) and the wide receive isn't great without an external antenna.

On the good side, the thermometer is pretty cool, I had the altitude option which was nice. The battery lasts a long time and the radio is teeny.

Good luck!

How does it compare to the intermod on the TH-6? From all reports I've heard, including from guys who have owned both, the intermod on the TH-6 is worse.

Wideband receive on the works great on the VX-5R with a 3rd party whip. I can get AM & FM broadcast, SW stations (like the BBC & Radio Nederland) and local TV just fine, as long as I'm not using the stock rubber duck that came with the radio.

I haven't had any 6m contacts yet.

I used mine on a cross country ride and enjoyed the readings over
Wyoming. Again, it was for fun, not necessarily for accuracy though it
did work as I'd climb the local hills.

Is it worth $30 for a what can be described as a gimmick? Probably
not. I'd have rather had an alarm clock in there (a la FT-530, the
best HT ever so far as usability goes)

JD

My intermod test is quite specific. I have a bridge across which I have to drive twice a day, called the Valley View Bridge south of Cleveland, Ohio. Only a couple radios will receive 443.3625 (KB8WLW, a friendly group of people in N.E Ohio) all the way across- normally repeaters give way to noise until across the bridge. This is on most HT's. The only other was my Alinco DJ-5 but that just got sold on e-Bay.

There are two other useful tests. "Intermod Alley" on I-271 north between 480 and Chagrin. This radio hasn't let in one peep of pager noise *except on the 'B' receiver.* None of the above applies if one is on the 'B' receiver. It is broad and picks up bunches of noise. Then again, its primary purpose is a wideband receiver, so I kind of expect that. It came as a pleasant surprise to realize I was talking with a friend through the Alley without ever beeing bothered by the noise. Remember, this is all on 440.

Downtown Cleveland rendered the VX-5 unusable on 440, but never had a problem on 2m. The TH-F6 doesn't seem to be bothered on any frequency, at least none that I've yet found.

YMMV.

I was thinking the same thing. I could get my wife to buy it for me by telling here that if she bought me that radio, I could sell off the MFJ-9406 for around $125 - 150 and the 2m to 6m transverter for $75 - 125, making back some of the cost of the radio! :)

Of course then I'd have to get a seperate 6m vertical since the transverter is used on the 2m/6m dualbander with the 2m radio. :)

> Anybody can comment Yaesu VX-5R?

I've been very pleased with my VX5R; probablly the most durable Ham HT made.I have experienced very little intermod problems,in an urban environment--certainly no more than comparable hts.

The wide FM recieve,and extended RX is a plus. The secret for SWL,is to attach a random length of wire,at the top of the antenna, where the 6M loading coil screws in---

6M FM ok w/ external antenna.

For really comprehensive info,along with free programming software,try this site;

http://www.icongrp.com/~sllewd/

6521. TS-140S warming up deaf: Help!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-27 01:03:07 UTC
From: EA4ADD, "Pedro J." <pjruiz@attglobal.net>
Message-ID: <3c02e470.522499@news.bcn.ttd.net>
Source record: 51475
Cross-posted to: uk.radio.amateur,rec.radio.amateur,rec.radio.amateur.equipment

Hi everyone!

After almost ten years working good with my Kenwood TS-140S, it now uses to become deaf suddenly when turnig from TX to RX as it normally warms after 15 minuts transmitting in a normal QSO.

Such a receiving malfunction right after transmitting seems to be as a result of an antenna commuting or switch relay failure while the cabinet's bottom heats up or something, but it resumes with an open hand slap and casual clapping in the top.

When transceiver is cooling down enough, then it works normally back again.

Any suggestion?

Please... I need somebody's help.

Thank you very much in advance.

6522. Mobile amp wiring question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-27 01:24:56 UTC
From: ve3tmt <ve3tmt@rac.ca>
Message-ID: <uSBM7.6363$cC5.960048@news20.bellglobal.com>
Source record: 51476

I plan on mounting a 10m amp in my trunk to boost the punt output of my Titan all mode. I currently have a switch on my dask from my old foglights that I will use to remotely power it on. The main power will be tapped off the stereo audio amp currently in the trunk. My question is this:

Can I use that 12V source to both activate the turn on relay and supply main +V to the amp? Or will this cause problems for the stability of the amp?

Thanks,

Max ve3tmt@rac.ca

So,.... you're essentially saying the internal tuner is NOT a real tuner in that it can't tune anything that is not fairly near 50 ohms to begin with, in which case one may not even need a tuner?

When you say it is mute, do you mean that there is just no speaker
audio, or is it staying in transmit mode?

I am looking at my schematics, love my TS-140S, you might want to check
K16 on the Filter Unit (X51-3040-11). This one switches the RF path for
Tx an Rx. If this one doesn't switch to Rx, then the incoming RF goes to
the output of the RF amp. Not good. I am assuming a mechanical relay
problem since hitting the rig causes proper operation.

You might want to try reseating connectors.

Another relay in the receive circuit switches the attenuating resistor
in and out and is controlled by the 'ATT' switch on the front panel.

Hi Group,

I would like to buy a Millen 90800 or 90801 exciter and 90831 modulator in any condition, working or not. I am also looking for the coils for the same. They are 43000 series coils from Millen and I think National also made them. I would also be interested in the parts to make the coils, the ceramic bases (2" between outer pins) and the Miniductor/AirDux raw coil material.

Thanks

>>From all reports I've heard, including from guys who have owned both, the intermod on the TH-6 is worse...

I live in Intermod Land - Southern California. In the most populous region of the nation's most populous state.

Regarding "intermod," the Kenwood TH-F6a is an impressive performer - on all three of its bands, using the stock antenna.

I, too, read some horror stories about the unit on the 'Net. So I bought a second one - from Kenwood's "2nd wave" to hit the West Coast. It, too, performs as advertised.

I cannot find fault with units that perform well for me. And with 2 meters, 220, and 440, it is the "ideal" HT for what I want to do during the day.

I have read a negative "review" on this unit from a gentleman who never turned one on in his life (obvious due to so many glaring errors of fact). I have read one person degrade this unit because the antenna was physically "sticky" (a coat of Lemon Pledge cured that...). A couple other "informative reviews" were from folks who were either illiterate or chose not to read the owner's manual for solutions to perceived problems...

You just can't trust everything you read on the Internet, unfortunately. 'Cause I am sure the vast majority of TH-F6a owners are quite pleased with their new HTs...

Sorry, but I and others value this type of information. In recent years, some distributors (and individuals) have adopted the attitude that they have no responsibility in the transaction after they give it to the shipper. My viewpoint is that the seller bears full responsibility for delivering the item to my door and I owe the seller nothing until that occurs. That point of view is supported by the legal system, and most importantly, by VISA and the other charge card companies. The fact that you've had nothing but good experiences with Texas Towers is fortunate, but not much consolation to the guy who had to go haul the tower home.

Since the buyer undoubtedly had to pay for the trucking, the seller assumes the responsibility for spending the buyer's funds wisely and choosing a trucking company with a terminal in proximity to the buyer so that the trucking company can deliver it at reasonable expense. I personally have shipped a tower 1000 miles via trucking company (residence to residence) and had no trouble finding a company who would do that - it just took several telephone calls and asking the right questions.

Looking for the following radio repair/resto items:

Heathkit RX-1 Mohawk:
- nice front panel with good paint/lettering, no extra holes
- one small satin chrome knob
- bellcrank from bandswitch linkage
- nice dial drum (yes, I know about the repro's)

Ten-Tec Triton IV or 544 analog:
- nice front panel with all paint/lettering intact (need only the aluminum panel, not the dial bezel and related parts)

National VFO-62:
- outside cabinet, no dents, no deep rust, ok if needs paint
- 1.0 Mc calibration crystal (FT-243 holder only)

Kenwood TM-2550A:
- service manual (or decent copy thereof)
- inline PWB-mounted plug where PL board plugs in

Sonar CB radio Model C, E, G, or H:
- three knobs
- mobile mount
- original hand mic

Miscellaneous:
- one 6CR6 tube (a good used one is fine)

Thanks and 73,
Dean K5DH

6552. Antenna Tuner Discussion.

Gang,

Drumming up some feedback...

Looking for what antenna tuner you think is the best...and why...want some feedback on high end gear.

I have a Nye MBVA, which is going back to Nye again for the same problem. They use high quality components, surrounded by simply stupid design. For instance, the plastic push rod for the insertable capacitors is "ended" with a screw. This screw is part of the contact point which just happens to be the point of most heat.

Run a KW into this thing at 2:1 and the contact point heats up...melts the push rod...another $150 repair bill from our friends at Nye! By the way, it is a "bear" to replace it yourself and when asked why they use such a dumb design, they simply say "Oh well".

I run RTTY and QRO CW and SSB but my antennas (TH11DXS and a well tuned Butternut) are pretty flat...with only a tweaking needed at the band edges. Nowhere is the SWR above 2:1.

Soooo...once it the NYE is repaired, I'll sell it...and want to pick up something with heft. I don't operate 160 so that is not a concern.

Feedback please....much appreciated....

6558. OPP how to get rid of skauking

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-28 00:21:16 UTC
From: R&D Smith <rdsmith@recorder.ca>
Message-ID: <AbWM7.6$4j2.759842@localhost.localdomain>
Source record: 51362

I am monitoring the OPP (Ontario Provincial Police) They have 9 different towers with an abc in each division so itd would go 1a 1b 1c, 2a 2b 2c and so on and every tower has a mobile and a base frequency or a frequency and a mobile where the frequency being the tower. ex. 1a mobile 139.470 1a base 141.390 1b 139.185 1b base 141.195 and so on.... and it says that all opp frequencies use CTCSS PL-TONE 107.2 Hz. Set your CTCSS tone to this to get rid of the computer generated squawking.... but its seems to be not working , i have a BC 245 xlt radio and i can pick up there mobile repeaters but i have a hard time getting rid of the squawking.. so could a OPP fellow monitor or someone who knows what im talking about please help me.... I have the winscan software and its has a spot where i can set the pl tone to anything i want os this apply to my scanner,, i am assuming so... so please help

> on all three of its bands, using the stock antenna.

Yeah, I live in SoCal too. My reference wasn't some guys on the internet, it was the people I met at HRO who talked to be about the radios they themselves own. When I was buying an HT, I was having a tough time trying to decide between the VX-5R, and the TH-F6A. I wanted 2m, 440MHz, and wideband receive. After trying them both, it seemed a toss-up to me, and I didn't have a preference betweeen 6m and 220MHz. The deciding factor was the guy at HRO who said he would rather have a VX-5R because he thinks it's a better radio, but he owns the TH-F6A simply because he also owns a 220MHz repeater. Considering that the VX-5R was significantly cheaper, I took his advice and purchased that model.

I'm really happy with the 5R, but in retrospect I might rather have gone the other way, since there are a lot more 220Mhz repeaters in the LA area than 6m repeaters. I should have looked at the repeater guide first.

On the other hand, the only intermod problems I seem to have is on the Crescenta Valley ARC repeater during rush hour. And as I said before, I can pick up the big SW broadcasters at night, which I really am happy about.

Source record: 51364

All APRSers,

Check out the APRSPoint software on www.aprspoint.com. It utilizes Microsoft MapPoint to provide high quality, detailed street map data, and it integrates MapPoint in an easy to use interface. You can do address lookup, point to point routing with MapPoint, and it offers better maps than Street Atlas. Right now you can get Microsoft MapPoint trial version for $9.95 for 60 days. APRSPoint implements the latest APRS standard, and supports position, status and weather reporting. You can also do APRS messaging with it. It supports AGW packet engine to use sound card as TNC in addition to standard serial TNCs. It does station tracking, signal range plot and has GPS tracking capabilities. For details, go to the website and get the free APRSPoint trial software. thx.

news:3C030942.79A30D77@earthlink.net...

> When you say it is mute, do you mean that there is just no speaker
> audio, or is it staying in transmit mode?

Well, I can listen to transceiver just when receiving the strongest
signals by turning sound's volume control AF in full position as S meter
doesn't even move.

So it behaves as the antenna coax would be disconnected itself from the
equipment.

On the other hand I did set slide switch (S-1) on the signal unit to ON as
shown in the diagram (Page 36, 6-6-8 'Linear Amplifier Control') in order
to obtain a stronger relais's commuting RX-TX and viceversa. I don't know
the pourpose for the other switch (S-2) ON-OFF, but by turning S-1 from
OFF into ON the problem was fixed in a temporary basis as the trouble the
suddenly returned again.

> I am looking at my schematics, love my TS-140S, you might want to check
> K16 on the Filter Unit (X51-3040-11).

Where is it located within the transceiver? I found it in the schematics
diagram but now I'm trying to hunt it inside down the hardware. Will you
please tell what page number or chapter is at the Instruction Manual?

By the way, an optional CW Filter was installed there so I will better
check it too. Who knows?

> This one switches the RF path for
> Tx an Rx. If this one doesn't switch to Rx, then the incoming RF goes to
> the output of the RF amp. Not good.

God willing, I think it is not the case. Transceiver succeeds in
receiving, but quite often not in full.

> I am assuming a mechanical relay
> problem since hitting the rig causes proper operation.

That is correct just in part, but cooling downn is causing a proper
operation for the rig, nor a warming up I fear.

> You might want to try reseating connectors.
>
> Another relay in the receive circuit switches the attenuating resistor
> in and out and is controlled by the 'ATT' switch on the front panel.

Yes, I use to push ATT switch ON when operating in 40 meters band to atenuate strong signals there but problems lightly began almost a couple of years ago by using the rig for packet radio in FM. Then, operating in AM and now... SSB too.

Today it is not so easy to manipulate an up to date technology transceiver, no matter if it was made last XX th century but we are not talking about a Heathkit device... so I'll keep the transceiver switched ON to get it warmed in RX position for a couple of consecutive days or more, in order to maintain RX-TX switch relay warm in receiving position. Then I will see what happend.

It is more than probably that I must find a good Kenwood service here in Madrid.

Thank you very much indeed for your help, Jeff.

Yes. Restating, what I meant was it would appear the tuner in the 746 is far less effective in tuning to these mis-matches than an ordinary stand-alone tuner. I hadn't realized that.

TexasTower In my humble opinion is a GREAT place. I've bought several towers from them over the past 9 years, and loads of antennas, and radios. I've also bought from HRO, and AES, and the HamStation. I've NEVER had ANY problems with Texas Towers of any kind. Everything I've ever ordered from them was via the web, or had to be shipped...as I have lived in New England most of this time.

I just wanted to put my two cents worth in about Texas Towers IMHO that are a GREAT ham resource. As are HRO, AES, and others.

I've always had an excellent experience buying from TT.

> What is the meaning of "25W PEP SSB"? Is it real 25W output? Thanks.

It means that it is capable of 25 watts Peak Envelope Power. With Single
Side Band it basically means that each transmission will vary since you are
not transmitting at maximum power with the mic keyed up. Gaps in speaking
etc. will not be using as much power as the peaks of the voice. Best way I
can seem to explain it........

I have for sale the Sherwood Engineering first-IF filter mod for the Drake R-4C receiver. This mod kit appears to be from the mid- 1980's and was recently removed from an ailing R-4C. Included are both the USB and LSB CF-2K/8 filters (5.645MHz first IF) and the 3 filter switch kit. The switch kit consists of one board (two TO-5 relays) that must be mounted under chassis on the long shield, and two more TO-5 relays that mount to terminal strips on the preselector bracket (along with the two filters). Requires drilling two small holes on an internal shield. Includes a copy of the complete installation instructions. $195 plus shipping. I can email jpg pictures of the filters on request. Also see the Sherwood Engineering site at http://www.sherweng.com

Was selling another HT at the same time.... was corrected on this about a month ago .... the HTX-202 is commonly known to be mono band FM.

The rigs sold rather quickly, most people understood the mistake right off. NimH is what the batteries are... note the term "reconditioned". How about that.... one can recondition a battery and replace NiCd cells with NiMh. Isn't that interesting.

I have a 12 year old TS-680 which is a '140 with 6M capability.

In my radio, the relay contacts which switch in the ATTENUATOR resistor are becoming unreliable. The receiver gain is noticeably lessened. The only fix (other than replacing the relay, which I plan to do) is to activate the ATTENUATOR button several times in an attempt to 'wipe' the contacts clean.

I'm speculating that because the relay contacts essentially never carry any significant current, over time they become oxidized. Anyone have any thoughts?

Ken, VE3FIT

->one of these in their junkbox that they wish to sell or trade? Thanks for
->any response. I know of a couple of sources but thought I 'd try here first.

You didn't say whether you were doing picowatts or gigawatts, and it makes a
hell of a difference. For milliwatts, Rat Shack has some little sugar cubes
that won't cost but a couple of bucks. For watts, 12 volt filament transformers
come to a pretty close match.

Above that, yer on yer own.

::
::When transceiver is cooling down enough, then it works normally back again.

suggest:

get can of ''freezer spray'' from any good electronic supplier with
the small nozzle-tube for accurate spraying

think logically where the fault might be.

wait for the txrx to warm up.

using short spray-bursts spray a small section of the txrx each time

when the fault seems to have ''cured'' wait for it to warm-up agin
and repeat the spray.

eventually you will be able to spray the exact componnet causing
the problem.

remember that freezer spray will cause 'dampness' so you should
allow your txrx to really warm up and 'dry out' before too many
sprays with freezer.

you can do the opposite (extra-fast warm up) with a soldering iron
but remember to watch for short-circuits !!!

I have for sale two Eimac 4CX1000A's.

The first is unused and was given to me several years ago by a good friend. It is marked as "Electrical Sample" and was reportedly rejected

by Eimac for cosmetic reasons. I checked it out today in my 30S1 using a dummy load and a Weston 0-8A RF ammeter, and it easily delivered 1800 watts, which is above Eimac's specification. The price is $200 plus $6 shipping.

The second is used and I believe it is a pull that I obtained at a hamfest some time in the past. I checked it out today, as described above, and it easily delivered 1800 watts. The price is $85 plus $6 shipping.

Contact me either by e-mail or at 540-745-6825 anytime.

73, Joe

Thats exactly right. They aren't meant to be "full range" tuners. They
can't handle much over a 3:1 mismatch. All those built in tuners are
for is to give you a wider usable bandwidth with an antenna that is
already fairly close. IE: a line flattener. I've never had a rig with
a built in tuner. Never really needed one being I have a couple of
real tuners outboard. MK

Wonder if you can tell us how you get 1800 watts out of a tube with a plate dissipation of 1000 watts? In a 30S1 , a 4CX1000A will start to draw grid current over 1000 watts. This is a zero grid current tube. The tube lasts about 1 minute pulling 2 or 3 mils of grid current. See Eimac spec sheet. Maybe I have been missing something over the last 25 years when using this tube.....

Just installed the ClearSpeech DSP Noise Filter base unit on my TS450S/AT with SP-23 Kenwood speaker. This is my first experience with DSP noise filtering. I got a demo of this unit from AC6AA who uses it on his FT1000MP instead of the built in DSP because the ClearSpeech unit works so much better. The unit couldn't be any easier to use. Hook up 12vdc - plug the xcvr audio into the ClearSpeech and plug your external speaker to the ClearSpeech. There is nothing to adjust. The key to the performance of this DSP is the proprietary algorithm which they have licensed to use. http://www.nctclearspeech.com/

This is the best Ham Radio accessory I ever purchased. I value this more than adding my AL-811H a couple years ago because "if you can't HEAR them you can't WORK them"

These units are only available from Am-Com here is the URL for the base unit

http://www.amcominc.com/productdetail.cfm?Prod_ID=17

They also make a self-contained DSP extension speaker perfect for mobile use

http://www.amcominc.com/productdetail.cfm?Prod_ID=16

Hi:

I have found a few more Blank 16 Pin Series
Logic Boards with the ver 5.34 Firmware installed.

You too can upgrade your older series Maxtrac
or Radius Mobile to 32 channels.

So, if you have a radio with a corrupted or Damaged
Logic Board, or perhaps wish to upgrade your radio to
32 channels, this is the ticket.

I also have made detailed instructions on
a step by step proceedure in the event you
need them.

I also have some New Digital Front Covers
too. Perfect for Converting those older
series 2 channel radios to 32.

The Blank boards with instructions:

$135.00ea+ $8.00 for shiping and handling

If you desire just the Ver 5.34 Firmware, I have
about 10 left from the factory tube.

$18.00ea+ $5.00 S & H

Terms:

PayPal Now Accepted !!

Acceptable PrePayment in the form of a Postal Money Order, PayPal (If
immediate shipping is desired) or a Personal / Business check is A-OK too if
you do not
mind a Short Shipping Delay due to bank processing time. This is required only
the first time or two as once you are in the data base, PrePayment is no longer
required

If you can find one, (I see them here or on rec.radio.swap) the old Johnson KW matchbox is just about indestructable, if you can live with its lack of WARC band coverage and a more limited matching range than the roller inductor tuners.

The KW Johnsons were rated to handle a kilowatt of plate modulated AM, which means they can handle 4 times the voltage on a kilowatt carrier.

Now, a caveat. In those days, everyone talked about input. About the most efficient class C amplifier would be 75 per cent efficient, so at a kw in thats 750 watts out. At that level, on AM, the voltage peaks would be the same as a carrier at 3000 watts.

So, at 1500 watts output there is a 2 to one margin for error.

In actual practice, they were even more conservatively rated.
The CG station at Cape May, New Jersey used a slightly modified one (taps on coils changed) on 5 MHz at 5 kw cw output with no problem.

The matching range is not infinite, especially on 80 meters, but if all you need to do is touch up some nearly resonant antennas, it will be OK.

The Johnsons cover 80, 40, 20, 15 and 10, no WARC bands.
A friend has used his to match an 80 meter sloper on 17 meters using the 15 meter band position. And I suspect 12 meters would be workable on the 10 meter band position, although in both cases the range of matchable impedances might not be exactly the same as on the bands it was actually designed to cover.

Thirty meters is probably out, without modifications. That is not very near either 40 or 20 in terms of the percentage of frequency difference.

news:weTM7.125943$636.17199648@news02.optonline.net...
Gang,

Drumming up some feedback...

Looking for what antenna tuner you think is the best...and why...want some feedback on high end gear.

I have a Nye MBVA, which is going back to Nye again for the same problem. They use high quality components, surrounded by simply stupid design. For instance, the plastic push rod for the insertable capacitors is "ended" with a screw. This screw is part of the contact point which just happens to be the point of most heat.

Run a KW into this thing at 2:1 and the contact point heats up...melts the push rod...another $150 repair bill from our friends at Nye! By the way, it is a "bear" to replace it yourself and when asked why they use such a dumb design, they simply say "Oh well".

I run RTTY and QRO CW and SSB but my antennas (TH11DXS and a well tuned Butternut) are pretty flat...with only a tweaking needed at the band edges. Nowhere is the SWR above 2:1.

Soooo...once it the NYE is repaired, I'll sell it...and want to pick up something with heft. I don't operate 160 so that is not a concern.

Feedback please....much appreciated....

Lou N2TU

Well... there are many things that can happen to a radio between the factory and the customer.
I think you will find that whether Texas Towers, or AES they will have the same shipping and return policy on most rigs.
They're re both good outfits to deal with and both have the customer pay the shipping back to them. There may be some exceptions, but in general that is the way it works.
I purchased almost all of the tower accessories from Texas Towers as they had them in stock. I purchased a bunch of antenna accessories from AES as they had them in stock. I purchased the 756 Pro from ComDac as they had one at a swap for a good price.

I asked for solder type N connectors, but we had a bit of miscommunication and I ended up with the compression type. They (AES) shipped out the proper ones right away, but I had to pay for them. I get the money back from the first ones when they receive them back I also have to pay the shipping back.

I have no problem with that.

Both companies are open about their shipping and return policies. I have purchased quite a bit of *stuff* from both companies over the years. ComDac in Michigan is another good company to deal with. Not as large as Texas Towers which is not as large as AES, but a nice family operation with which to deal.

BTW, I have no connection to, or interest in the operation of any of these companies. They are just companies from which I have purchased ham gear and accessories and have had no complaint about their practices.

All I will admit to is running legal limit wattage. The most
challenging match for most tuners is mismatches on 160 meters. My
inverted vee is cut for 1840 khz and presents an swr of over 3 to 1 at
the top of the band. I can run legal limit anywhere on the band.

The unit is bigger than some desk top linears. The internal
components are top rate, and Paul at Palstar is very easy to deal
with.

You almost never see a used one for sale. What does that say for it?

Source record: 51309

Hi Folks,
Any Oldtimer out there remembers the TempoOne alias SommerkampFT250
alias yaesuFT200? Just bought one; works perfectly. Just a slight
minor problem.
TX/CW is only possible with the mode-switch in the OP-position causing
complete
mute of the RX while the original manual says that full-break-in CW is
a possibility by activating the vox-switch and adjustment of the
var.resistors on the rearside.
Tried all variations but can't figure it out. The main question is:
what must be the mode of the OP-REC-CAL switch for working CW-bk-in;
OP or REC and how to adjust the var.rest. properly?
Suspect this function is broken, so try to find a beginning where to
start repairing it; in the OP or REC mode?
Please give me a clue.
Thanks in advance; greetings from Hans/PA0GNS

P.S. If anyone needs a copy of the manual/schematics just send me your
email-adress

As for the RA17:
Just one question; The H1/H2 link at the backside, is it - apart for
connecting
the adaptor - also suitable to use it as a break-in function while
transmitting with the Tempo One as I think its reception is much
better, but am afraid to blow up the first RF-amp.

He asked for a good HT recommendation for a beginner..
Not a post from you fluffing your ego-feathers, Clint...

Personally, I'd recommend my 1st radio.. The Icom W-32A.. I've had
smaller, for sure, but it's "super simple" to use for a beginner and isn't
going to be outgrown in a few mnths or put aside for "a more serious radio"
during backpacking trips, emergencies, etc...

I haven't used a KW+ amp in 20 years but I seem to recall that the plate tuning circuits could easily match up to an antenna with reasonable SWR. I use an external tuner on my solid-state 100w rig to "flatten" the Butternut but assumed amp's still had circuits like the commercial/military amps I recall. How about bringing me up to date on why an external tuner, especially a very good one, is needed with a modern amplifier.

6620. Re: Antenna Tuner Discussion. Johnson match box

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-29 18:51:06 UTC
From: KA9CAR <nospam@nospam.usa>
Message-ID: <9u5vvlcds1@news.tribune.com>
Source record: 51324

The emphasis is on "potential limited matching range"

I use a Johnson 275 watt box, which is the same values at lower voltages as the KW box.
I use it on all bands from 80 to 10. For 30 I use the 40 position. 17 works on 20, 12 works on 10 or 15.

I am using it with a 300 ohm feed line to a random length (200 + feet) horizontal loop.
KA9CAR

Bill Reichert <n9hh@charter.net> wrote in message
news:u0avdae0s0soec@corp.supernews.com...
If you can find one, (I see them here or on rec.radio.swap) the old Johnson KW matchbox is just about indestructable, if you can live with its lack of WARC band coverage and a more limited matching range than the roller inductor tuners.

The KW Johnsons were rated to handle a kilowatt of plate modulated AM, which means they can handle 4 times the voltage on a kilowatt carrier.

Now, a caveat. In those days, everyone talked about input. About the most efficient class C amplifier would be 75 per cent efficient, so at a kw in thats 750 watts out. At that level, on AM, the voltage peaks would be the same as a carrier at 3000 watts.

So, at 1500 watts output there is a 2 to one margin for error.

In actual practice, they were even more conservatively rated.
The CG station at Cape May, New Jersey used a slightly modified one (taps on coils changed) on 5 MHz at 5 kw cw output with no problem.

The matching range is not infinite, especially on 80 meters, but if all you need to do is touch up some nearly resonant antennas, it will be OK.

The Johnsons cover 80, 40, 20, 15 and 10, no WARC bands.
A friend has used his to match an 80 meter sloper on 17 meters using the 15 meter band position. And I suspect 12 meters would be workable on the 10 meter band position, although in both cases the range of matchable impedances might not be exactly the same as on the bands it was actually designed to cover.

Thirty meters is probably out, without modifications. That is not very near either 40 or 20 in terms of the percentage of frequency difference.

"L. E. Dietrich" <ldietric@optonline.net> wrote in message
news:weTM7.125943$636.17199648@news02.optonline.net...
Gang,

Drumming up some feedback...

Looking for what antenna tuner you think is the best...and why...want some feedback on high end gear.

I have a Nye MBVA, which is going back to Nye again for the same problem. They use high quality components, surrounded by simply stupid design. For instance, the plastic push rod for the insertable capacitors is "ended" with a screw. This screw is part of the contact point which just happens to be the point of most heat.

Run a KW into this thing at 2:1 and the contact point heats up...melts the push rod...another $150 repair bill from our friends at Nye! By the way, it is a "bear" to replace it yourself and when asked why they use such a dumb design, they simply say "Oh well".

I run RTTY and QRO CW and SSB but my antennas (TH11DXS and a well tuned Butternut) are pretty flat...with only a tweaking needed at the band edges. Nowhere is the SWR above 2:1.

Soooo...once it the NYE is repaired, I'll sell it...and want to pick up something with heft. I don't operate 160 so that is not a concern.

Feedback please....much appreciated....

Lou N2TU

I got my new QST mag and saw an ad for the new IC-746PRO never had an idea it was in the works anyhow 6khz AM filter (as opposed to the 9khz filter) so no filter swap required, 32bit DSP/24bit AD. anyhow went to ICOMs website it seems they really gutted the insides and improved upon the 746 by a big margin. I was planning on getting a IC-746 but now I would rather get the 746PRO. anyone know more about this?

If you have a scope, it might not hurt to check the crystal on the
uProcessor. Multiplexed displays are often timed by the cpu and will go
dark(or light...) without the CPU running.

Looks awfully tempting. I'd wait for the QST review, tho', to make sure the new
digital filters work, in place of the old crystal jobbies.

2 meter only: Radio Shack HTX-202. Used ones are cheap, you can
replace cells in the battery pack and performance is great.

Dual band: Kenwood TH-77 or Yaesu FT-51. Both receive on both bands
at once and work well. The FT-51 can be programmed from your PC, too.

Now, what HT's to avoid?

Could be a dead regulator also. Many radios use 12V for the audio amp, and PA, but run the rest of the circuits on 8V or something similar. Since the backlights are not likely regulated, it could be the case.

There are some IC's that are designed to control a radio chassis, and act as the 8V regulator, and also provide the switching to go from RX to TX (osc gating, RX muting, etc). Seems like MB 3756 was a common one, but I haven't changed on in many years so that may be wrong.

They are often an 8 or 9 pin chip in a single inline package that looks like an audio amplifier IC. They are designed to be bolted to the chassis for heatsinking. If you see something of this type, you might want to take a couple DC readings with a meter. These parts used to fail quite often, but seldom when stored. When jump starting batteries, etc it was common.

Beyond that, it would take a schematic and the normal troubleshooting efforts to find out.

6639. KENWOOD TS-930S(D) - FIX FOR AF GAIN PROBLEM

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-30 04:16:10 UTC
From: n0ss@earthlink.net
Message-ID: <3c0703e0.1300221@news.earthlink.net>
Source record: 51342

If you have a Kenwood TS-950S or TS-950SD, read on...

Recently, I found that my TS-950SD (which I'd just purchased from an estate) had a problem with loss of control of the RF GAIN _if_ I had the AGC turned off and I tuned across a strong signal (maybe 10dB stronger than the level I'd preset with the RF GAIN control). I'd be copying CW (yeah, some of us still do that), with the AGC turned OFF and controlling the audio level by varying the RF GAIN control. Then, as I'd tune up/down the band, I'd run across a strong station and it was as if I'd cranked the RF GAIN all the way UP... BUT I no longer had ANY control of the RF GAIN as long as I was still tuned to the strong statons. I mean, it didn't matter if I turned the RF GAIN all the way DOWN... the signal was still coming thru FULL BORE. I'd have to either tune off the signal, wait for him to stop sending, ot turn the AGC back on for a brief second in order to recover from the problem. And even then, if the station was still sending, as soon as I turned the AGC back OFF, I'd again lost control of the RF GAIN.

I queried several friends who also have '950s and BOTH of them reported experiencing the same problem..! Then I posted a query on the CONTSTING.COM reflector... fully 75% of those who responded were also able to reproduce the problem on their 950's.

I dropped a note to Kenwood, in the hope that they had an unpublished fix. I figured that since so many others had the problem, Kenwood HAD to be aware of it.

I week passed and then I received a reply from Kenwood. The reply included a .JPG file of a possible fix for the problem.

I tried the fix last night, and it worked LIKE A CHAMP!

The JPG I received from Kenwood was pretty 'ratty' and somewhat difficult to use. Additionally, it didn't include ANY info on WHERE to look for the locatin of the problem componenst, other than that they were on the Signal Unit board... moderately large board, LOTS(!) of tiny SMT components mounted on the BOTTOM side, and NONE annotated either on the board OR in the User's Manual (you gotta have the Service Manual for that type of help).

Well, I finally managed to dope out where the parts were located, and made the mod. The difference in performance with AGC OFF is SUPERB!!! If you have a TS-950S or 'SD, even if you don't have the problem, you still should have the mod, in case you have the problem later... I understand that it also exists on other modes IF you turn the AGC off.

Since proving that the mod DID, in fact, work, I have completely re-drawn the document from Kenwood, and added several photographs of my TS-950 before/after the mod, I also included a pic of the entire Signal Unit board, with a box around that portion of the board where you'll find the parts which need to be worked on.

The mod is easy to perform... you only REMOVE components. Nothing, other than two jumpers, is INSTALLED!

If you are interested in obtaining a copy of this mod, please drop me an E-MAIL (only) to: n0ss@arrl.net and I'll be happy to send the file back to you in return as an ATTACHment to the reply. The file is about 850kB in size and is in Acrobat Reader (.PDF) format. And it's free.

Hi John,
Well I did a little calculating and with just a base set of
frequencies at 151 mhz, 600 khz seperation you would need at least 10
feet of verticle seperation or about 90 feet of horizontal seperation
between the 2 antennas to provide the amount of isolation needed to
operate a repeater in the manner your describing. If you decide to
undertake the 2 antenna project remember that the should be offset
from the mast at least 6 feet and directly inline with each other.
Also put your receiving antenna above your transmitting antenna as you
will be trying to pull in the weaker signals from the portable radios.
Let me know if you have any other questions. Hope this helps you.
Good Luck, Matt

> Bob
> k5qwg

how are DSP radios like the 756pro etc.. like compared to mechanical
filters
I never used or even seen one in operation so I have no idea what they
sound like does voice etc.. sound different or artificial or does it
sound just like a
normal radio and is the filters IE a 6khz am or 2.8khz am better in
DSP when there is a strong signal near etc.. DSP sounds like it does
it all but I always figure there has to be some bad side to DSP

anyhow hope the FCC gets it approved

RS part # 32-1031B
(70 volt 10 watt line transformer)
connect primary C and 10 to R390A 6 and 7 TB102
secondary C and 8 to speaker.

Put one on mine yesterday.

Jim

What I had to do to get 15mrs to work, might for you. Kenwood used tin plated connectors in the rig. you have to take the rig apart and clean all molex connectors then put it back together. I coated pins with electrical grease (silicone)

I have a 746 - not real impressed with the "new" Pro model - would FAR rather see the display
upgraded for better visual representation and a band scan operation that will function while the
receiver is active, as the 756 series does... As far as *I* am concerned, the existing filters are
quite adequate for normal, all around operation, as are the DSP and other features now supposedly
"upgraded"...

Will wait for reviews...

While the below post reads more like a paid advertisement, *I* have to agree that the ClearSpeech
speaker is EASILY the best accessory in my mobile - wouldn't even CONSIDER mobile operation without
it - along with the variable additional DSP provided by my Icom 706 MKIIG, it's almost like having a
squelch that permits only the desired sigs to be heard thru ambient noise levels - a GREAT product...

JEEZE - *that* reads like an advertisement TOO! :-)

Source record: 51262

Try Scott Davis' ACLog 1.8. I have been using his software for a couple of years now. ACLog is the basic general purpose logging program. It keeps track of your dx countries, qsl's sent and received, counties (for you county hunters), and sorts and prints labels for you. Pretty much everything you need. His contest software is first rate too, used them for field day, November Sweepstakes, and ARRL Internation DX contest the last couple of years. I just got an email from him the other day that he has added rig control software to the latest versions of the contest software, but I haven't checked that out yet. You can download a copy from www.n3fjp.com . I don't have any connection with him other than being a satisfied user.

IIRC, these were radar pulse modulators used in WWII. They were on the surplus market in the early 50s for fifty cents new-in-the-box until someone discovered they had platinum grids after which they all promptly disappeared.

6665. :FS: HT600 VHF/DTMF/Chrgr/SP-MIC $125 shipped or TRADE.

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-01 00:11:21 UTC
From: "R. Belcher" <randy.belcher@verizon.net>
Message-ID: <JeVN7.360$Cv.26248@typhoon1.gnilink.net>
Source record: 51269
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Hi all, have 1 each HT600 radios as follows: (LAST ONE!)

VHF 154-174 (will actually do about 151-177)
6ch
5watt
Includes programming.

Radio, 2 Batteries, Antenna, std. charger.

Model H43SVU7160BN

Condition: EXCELLENT. 8/9 cosmetics (I noticed some small picks/tears in sticker around dtmf keys in a couple of these radios. fingernails??)
10/electronically

NO beltclips
NO accy caps
NO guarantee on the batteries... they're holding a really good charge but most are 2-3 yrs
or older.

YES, the radio is guaranteed to be in proper working order, factory, no conversions, no jimmies or funky stuff. These came from a biz in NC and were used in a manuf. plant I believe. Very nice condition.

NOTES:
These radios will do a good job transmitting from about 151.600-177 as I have
mine configured. If you need a freq. outside 154-174, I can have it programmed for you. Ask me for details if you need.

" .ZIP File " relevant to this radio included or emailed if necessary.

PRICE:
$125 shipped to your door (CONUS) Priority, Insured, Tracked.

Money order, Mastercard/Visa via PayPal

TRADES:

First of all I apologize for this (thank the morons out there) but I will only trade with people who are:
1. Willing to call me and discuss equipment.
2. Able to give a 'no-questions-asked' return policy with guarantee on equipment traded.
3. VERIFIABLE in some shape, form or fashion.

I will extend and return every courtesy, then some, for honest and dependable folks. Most of you I'll know anyway...

I'm looking for handheld radio stuff, electronics or ???
Will trade for a ham handheld or mobile if it's a nice one.

THANKS!
Randy

6668. Uniden Repeater/Motorola MARTI/GMRS

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-01 00:55:19 UTC
From: "R. Belcher" <randy.belcher@verizon.net>
Message-ID: <XTVN7.370$Cv.27568@typhoon1.gnilink.net>
Source record: 51272
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap

Uniden ARU251K Repeater, UHF 25watt, Built-In Duplexers.
on GMRS now, Has hangtime, courtesy tone, etc.
462.650, I believe... has tunable TPL encode/decode. It's crystal but has built-in
duplexers. Its only problem is the power supply went bad. It is now set up with a 12vdc cable hanging out the back to hook to a supply like any radio. The 110 cord was removed also. But, works fine sitting here on the desk with a mobile whip in the window. Wattmeter says 20watts out the duplexers
so power is fine, too. Cosmetics get a 5. Electronics in 10 condition. Has scratches, rubs, etc. but nothing affecting operation. Not excellent, Not beaten.
Includes regency handmic but no duplexer jumpers.
It be heavy!

Second item is a Motorola MARTI phone patch. This is the larger, configurable model that should fit any repeater. 19" wide, and model is L1159A. Comes with wall supply. Excellent condition!
They were not originally a set, but should work fine if necessary.

Asking $350 for both plus shipping costs and may trade for
other motorola, Kenwood handheld, mobile, radios, equipment, etc.
Curious what's out there....
Will consider ham stuff, too. (newer items)
See HT600 posting for trade info, and thanks!!
Randy

I have an Icom R7000 (cell not blocked) that is in perfect condition and with very little use and am considering selling or trading it. I bought this unit a while ago for a pretty penny and am wondering what the current price these used rigs are being sold for today. I tried searching ebay to get an idea of price but didn't have much luck. Any opinions would be helpful.

Please reply to the NG.
Thanks,
Gary

Do Comet or Maldol have any information about the new antennae on their web sites?

Dave,

Make sure you are using a accurate VHF watt meter and good load. A resonant 2 meter antenna will suffice if you are not sure of the load. I have a 746 and 2100H. Using a inexpensive 144-220mhz MFJ 812B watt meter and a Ringo Ranger 2, both radios provide the maximum specified RF power output at my shack (100 & 55 watts respectively). In another reply to your posting, it was mentioned that low power on 2 meters was a ongoing problem with the 746. I read these newsgroups almost every day and that's the first I've heard of it. Just be sure of your power readings before sending the radio back. Good luck.

Try a different meter.
If they both agree, THEN you might have a problem.

Hi , I purchased 2 walkie talkies at a fleamarket and wondering how to charge them? anyone??

1- they both have I think a nicklecadnium pack with three cells wrapped that I put my 9volt wall adapter on and they charged up and worked but I am wondering how long to charge them for? There is no amp hour rating or anything on there at all.

2- Is there an easy way to tell what frequency they are on other than freq counter ? A friend has a Yaseu FT530, will that tell what freq some how?

Any help is great thanks

I would suspect, that if you can manage any names/numbers at all off these radios, someone in this newsgroup would be able to point you in the right direction. What type of antenna is on it?..How long? Are there any colored dots on the radio? Believe me, any little tidbit you might give, could help identify it.

I have a Radio Shack pro 2034 scanner.
Problem is , i can program most anything
into it , but when i put in any freq around 470 to 475, it does not rec
anything.

I reset it and just put in 472.4125 and nothing.
My HT rec that freq fine. It's the local police.
I put in a local repeater and that works fine .
Any Idea's.

Hi All;
I am looking for the add-on TNC kit for the PacComm Pactor Controller.
This unit was made in the early 90's and added packet capability to the HF
Pactor Controller which already worked for Amtor and RTTY!
Does anyone have one of these units sitting around?
My Controller already has the faceplate and switch for this mod.
PacComm, apparently, no longer support ANY of their Pactor products!

I agree - my 746, into a good match and with a good wattmeter shows nearly 110 watts out on
2
meters...

Source record: 51205

the tl922a is not rated at 1500 watts out, rather it is rated at 2 kw input at the finals, which corresponds to around a kw out as it is class ab2, with a max at around 1200, but only on ssb, as cw must be done at the reduced voltage level as per instructions. I would be wary of this rig as the seller is not describing it properly.

Many folks tend to make wattmeter cables that are a foot or two long.
Depending on the cable uised, these can end up close to a 1/4 wave on 2M,
and will act as a transformer, making that nice 50 Ohm dummy load look like
a much higher impedance.

Premier Communications is the U.S. importer for ADI amateur equipment.
And Pryme is a Premier tradename for audio accessories.

All can be found at http://www.pryme.com

Premier is one of the few firms that post their user manuals online -
they're all there!

NO ONE here can adequately answer your question, Kan...because we have
no idea what is happening in your region on the amateur bands.

Your BEST source of information would be a local amateur radio club.
Go to the ARRL's Web site and search for one: http://www.arrl.org

OR...do YOU already know what band(s) you want to be active on?

What's the RF Current Rating on these, any clues? Especially current rating at 30mhz.

There seems to be a quite few caps floating around with super voltage ratings, but with very low RF current ratings. If like me you need a plate blocker, RF current is important.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.swap,rec.radio.scanner

Do you have a need for a high-quality SMA-to-BNC antenna adapter that
is custom made to fit and protect your H.T. or scanner radio?

Adapter allows you to:
Quickly change antennas to base,mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to antenna
changes.

Adapter features:
Gold plated contacts with a teflon insulator.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed
for moisture and dirt protection.
The base also provides an excellent support for any length of antenna
or application.
No need to remove adapter once installed to make a quick and safe
antenna change.

Sizes to fit radio models:
Yaesu: VX-5, VX-1, FT-50-R, VX-10, VX-150, VX-110, VXA-100, VXA-120
Icom: IC-T8A, IC-T81A, IC-Q7A, IC-R2
Kenwood: TH-D7, TH-G71, TH-F6A
Alinco: DJ-V5
Standard: C508A, C510A
Radio Shack: HTX-200, HTX-400, HTX-245
Aor: AR-16

Previewed in the May 2000 Issue of CQ Magazine, and the Nov. 2000
Issue of QST Magazine.

$11.95 + $1.50 S+H(One to unlimited)

"MARS" is an abbreviation of "Military Affiliate Radio System". "CAP' is an abbreviation for "Civil Air Patrol" I don't know the specific frequencies but they usually are just slightly above and/or below the ham bands. There are separate Army, Air Force, Navy & Marine MARS nets. You can read more info about them here : http://www.asc.army.mil/mars/

CAP is a civilian auxiliary branch of the US Air Force.....more info here : http://www.capnhq.gov/

If the load is indeed 50 Ohms and the coax is 50 Ohms characteristic
impedance, the length of the coax is irrelevant. A 1/4-wave line will
not make it look like a higher impedance.

> Your choice.
>
> Barry - N4BUQ

A 25 volt line transformer set to 1 watt will have a 625 ohm primary,
and most have 4 and 8 ohm output impedance.

A 70 volt line transformer set to 8 watts will have a 625 ohm primary,
and most have 4 and 8 ohm output impedance

25V transformers = 25*25 =625 ohms/watt
70v transformers =70.7*70.7 = 4949 ohms This is rounded up to 5000 ohms
for calculations of 5000 ohms/watt.

In other words, divide the watts tap into the constant, and you'll get
the impedance.

600 ohms to 4 ohms is 12.25:1 turns ratio or about 120 Volt to 10 Volt

600 ohms to 8 ohms is 8.65:1 turns ratio or about 120 Volt to 14 Volt

These aren't exact but well within a fraction of an ohm.

6737. Tri-band HT antenna vs RD-98-SMA (Previously: Yaesu VX-5R Rubber duck alternatives?)

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-02 17:44:34 UTC
From: "Drink, WP3JQ" <NOSPAMdrink@coqui.net>
Message-ID: <tBtO7.87174$lV4.10841068@e420r-atl1.usenetserver.com>
Source record: 51244
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.antenna,rec.radio.amateur.equipment

Hi Chip,
MFJ makes the "Tri-Band FlexiDuck". The part number's MFJ-1720S and costs
$29.95. It's a 19in. tri-band with an SMA connector for HT's like the
VX-5R. As advertised, gain is as follows:
5/8 wave on 440MHz w/ 3.2 dB gain
1/4 wave on 144MHz w/ 2.15 dB gain
1/4 wave on 6 meters
I'm not sure why I've never heard anybody else discuss this antenna.
Usually, they cite the Premier (Pryme) RD-78 or RD-98SMA as excellent dual
band antennas.
The RD-78 advertises 3.2dB & 2.15dB gain on 440 & 144 respectively while
only 15 inches. I believe the RD-98SMA boasts the same gain figures and
measures 17 inches (yet, it's the super-flexible, "tie it in a knot" type.)
What I want to know is: if gain figures are the same, do the Pryme
antennas (especially the RD-98SMA) work on 6 meters?

Hi all!

Selling a lot of stuff here to make room for some new stuff. All prices
shipped CONUS unless specified otherwise. Shipping is UPS insured 1 day
after funds received.. All items in NW burbs of Chicago.

Icom 706MkII
I bought this new about 3 years ago.works great. never been in for
repairs.hand mic,manual and original box $680

Hallicrafters SR-150 w/PS-150-120
looks and works good. output a little low manual copy $275

Heath SB-101 w/HP-23/SB-600
looks and works good $275

Heath HD-1418 audio filter
works and looks good $55

Vomax 4-D
works and looks good- have copy of manual $65

Heath Apache
DOES NOT WORK!
lights up but no grid drive. some internal mods -cab and panel fair
pick-up only near Chicago $100

Shure 55 mic
...mult impedances. looks fair. heil cartridge in it now but will include
original pieces $75

Pro-26 handheld scanner.
I bought this new spring of 95. nice radio
$225

VX-5R
handheld... manual,orig box, a couple of extra antennas
$220

D-104 amplified mic
$40 or will throw in for $25 with the SB-101 or SR-150

Will consider trades +/- a few bucks for a ICOM-746, a Johnson Valiant or a
Drake TR-4C or CW

Thanks for reading

> covers 6m?

You're right, the SMA-503 is 2M/440 only. I never used the 6M
feature on the HT, figured I'd carry the factory antenna around in glovebox
or whatever in case I wanted 6M Tx capabilites. I like the 503 because of
its superior performance on 2M and 440 compared to the Yaesu antenn, plus
its low profile (thin) is better. Works great on my TH-6A now, too.

Hi All,

I have a 2 year old Kenwood TS-950SDX. I want to get the knobs off so I
can clean the dust out of the grooves. I have no trouble getting the 5 double
knobs off of the right side of the radio, but the 3 single knobs on the right,
and all the knobs on the left side will not budge. There are no set screws
visible. Have any of you had any success getting them off ???

Thanks,
****
Ron Goldstein.....KA2IIA

I've heard from some local hams that the 503 works well on 220 MHz,
even better than the factory TH-F6A antenna ...

Food for thought,

Am I missing somethin'? The Pryme antennas mentioned ARE good
dual-band antennas...excellent enhancements for anyone to "cite."

> What I want to know is: if gain figures are the same, do the Pryme
> antennas (especially the RD-98SMA) work on 6 meters?

I am not sure...but the Pryme RD-98SMA sure works well on 2m, 220, and
440 on my Kenwood TH-F6a...anthough it's not supposed to....

Hi Folks:
I'm working on this radio here. It has 3 bad cells in the battery pack. I just bought some more ni-cads for it. My Uncle, (his radio), keeps it in his truck, with his lighter pluged into the DC13.8V jack on the battery pack. (BP-23). I was just looking over the circuit board in this battery pack and it seems the DC-IN charges the battery through a resistor, and the battery runs the radio.. That sounds to me like a charging circuit! There is a smaller jack on the battery that is labeled WALL CHARGER that seems to do the same thing!
Here's my question: Can this radio handle 13.8 volts into the radio? And, are there optional 12V battery packs for this radio? Why is this wired like this? Is the NiCad a shunt regulator? Should I make a 7.2V reglated supply so he doesn't burn the NiCads out one after the other?
Any clues appreciated!
Harry

Hi Folks:

I'm interested in geting folks ideas and opinions on a few things....

First of all, does anyone have any experience/ideas/opinions comparing the Kenwood 440SAT with the TS 50?

Secondly, can anyone suggests sources for picking up either/both used and what a good price would be?

Thirdly, any ideas on a good mobile HF attenna?

And finally -- a VHF not HF question -- Any ideas on a good 2m all-mode rig? I used to have a Kenwood 751 before if got stolen by a bunch of punk who thought it was a CB! Love to replace it with something similar.....probably used (just to keep the price reasonable). Ideas suggestions and/or opinions highly appreciated.

THX and 73's!!

The 440 is a bit bigger, and maybe a few more features. The TS 50 is a
little bitty thing in comparison. Pretty good radio though. I'm not
sure which I'd want. Depends on what for...Maybe the ts 440 for
house/home use. But if mobile in a dinky car, I'd go the ts 50. The TS
50 is newer than the 440, so maybe more up to date...
>
> Secondly, can anyone suggests sources for picking up either/both used

Both are pretty close in the 500$ plus or minus range I think.
>
> Thirdly, any ideas on a good mobile HF attenna?

Bugcatcher, screwdriver, etc.
>

>
> THX and 73's!!

Loads of them...As far as the old ones, I was always partial to the
IC-251, IC-265, etc. The big all mode icoms...Good radios...They made
both 25 and 100w versions. Another 751?? It was a good one. Heck, for
mobile get a ft-100 or ic-706 and get both worlds in one box.
"HF-VHF/UHF". You can get an original 706 for about the same as a
TS-50 I think. It's HF-6m,2m, all mode. I see them going for 500$ or
so all the time. I've got a 706mk2g. Been a good rig so far. The "g"
is all mode HF-6m,2m,70cm. MK

I have NEVER purchased anything from Texas Towers, for the following reason: I travel quite a bit on business, and use the opportunity to visit Ham Retailers when in town, to see in person the quipment that i am interested in. As it turns out, i usally frequest cities where HRO is located. On a recent trip to Dallas, I stopped into Texas Tower to 'browse'. I found them to be rude, curt, and unwilling to spend time with me unless I was ready to drop down my cash on the spot. Now, I am looking at purchasing a new HF rig for the Base, as well as a multimode mobile, and am cosidering the IC756ProII, vs. FT1000DMk5, as well as the IC 706 vs.FT100D. Neither of these are impulse purchases, and I will not buy unless I compare hands on. The venfor that is the most helpful will get the business, and Texas Towers will never get it.

In Contrast, I have visited the HRO stores over the past year, and as a direct result of their courteous service, have purchased the FT817, VX5R, and VX1 from them. In addition, I has a similar problem, with my VX5R, a bad ground in the radio that surfaced within 30 days of getting it home. The folks at HRO in San Diego (Where I purchased it in store), overnighted me a replacement, while my return was crossing in the mail (even though it was technically out of the replacement window, and should have been sent back for repair).

I can't say enough for the folks at HRO, and will continue to shop there (and AES) as long as the service remains constant. Note: I have had the same courteous treatment at other HRO stores, so assume it is a consistent company attitude.

This hobby is by definition a 'word of mouth (or key)' business, and products live or die that way. So do Vendors!

Paul - N2HJK

Hi.

I recently purchased a used MFJ-989B antenna tuner but it did
not come with a manual. I downloaded the MFJ-989C manual from
the MFJ web site, but it looks like the B and C vintages are
different enough that I need the B vintage manual.

Does anyone have an "electronic" or "soft" copy of the MFJ-989B
manual (or a hard copy that you can scan in) to E-mail to me?

I tried E-mailing MFJ to ask about this, but they did not
respond.

If you post a follow-up, I ask that you also please cc.
my E-mail address.

Gee thanks Stephen but I'd rather got to

<http://www.electronics-plus.com/Merchant/merchant.mv?Screen=PROD&Store_Code=eplus&Product_Code=02-029>

and buy them for $4.00 each. BTW, they seem to have every adapter in the
world.

TT isn't "partial" to buyers... They've treated me the same (crappy), when I
went in there to browse and when I've actuaaly bought stuff...
It reminded me of the times when I used to look somewhat like a hippy and
would get treated about the same when stopping in at a small country store
in a 'redneck' area..
Maybe you also didn't "fit their prolfile" or something?

These are a disaster if you change connectors a lot. Stephens adaptor
has an extra rubber ring around it that prevents the adaptor from
wiggling and thus breaking off the HH side of the sma connector.

Bye Maurice

Hi Clint,
No, you're not really missing anything. My point wasn't that they weren't good antennas. They are. My point was that if you've a tri-band, what reasoning proceeds not mentioning a tri-band antenna with comparable gain figures to the dual band (besides the obvious benefits of lighter, flexible material).
I also realize that the tribander probably has a loading coil and, though the dualbander has similar gain, the dualbander probably isn't resonant.
But, I still pose the question (just for discussion and first hand views)
"How's the RD-98SMA do on 6m?"

Well glad to see I was not alone!!
I was in Dallas for a wedding and I was looking for a new Yaesu FT-840 a couple of years back, I called and got directions to the store. I drove about 45 min. to get there arriving around 3:15 in the afternoon. As I got out and approached the door, a guy came out the door locking it behind him. I asked him if they where open he said no we closed early today. I told him I called and got directions but that no one told me that they where closing or I would not have tried to drive up there. He never apoligized, or said anything really. I used to work at a pizza deliviery buisness, I was told from day one that if a customer calls in with a complaint the first words out of your mouth should be "I'm sorry, what can I do to make it right". Even if it was not your fault. 1 positive experience told to 10 people gets you on average 5 new customers, 1 bad experience will loose you 10 on average. Great customer service comes from the root word "Customer".

I have been a fan of the Hamstation in Evansville IN. I used to drive almost two and a Half hours from home to do buisness with them. Always willing to talk to you and help out. Support you local ham radio dealer, they keep the hobby going.

Mark

6796. IC-32AT Question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-03 17:53:38 UTC
From: Roland Stiner <nk2u@1stconnect.com>
Message-ID: <QWOO7.88267$lV4.11206477@e420r-atl1.usenetserver.com>
Source record: 51099

I have two ICOM IC-32ATs which when turned off still drain the batteries within a day. Checking it out with a VOM shows a resistance on the battery contacts on the radio side. Is there a fix for this?

Roland

It is an imaginary point radiator whose radiation pattern is a
perfect sphere. It is useful for comparisons.

>What exactly might an "isotropic radiator" be?

Hi Chip,

The meaning of the words is sufficient to explain: a radiator that emits the same (iso) in all directions (or turns - tropic). The net result at a great distance is as though the source (isotropic antenna) is a point in space illuminating or filling an ever-growing spherical surface with power. In contrast, the simple dipole, at a great distance, appears to fill a surface that looks like a sphere punched in from opposite sides (suggestive of a donut).

The charm of this theoretical radiator is that if you hold that uniform sphere image in mind while distorting it into the dipole radiation surface; you then come to observe that like a balloon being compressed, pressure forces other portions of the surface to expand. When you stand back and compare the two surfaces you will find that your dipole has more emphasis in one direction over the isotropic.

The net result is that when compared to the isotropic, the dipole "reaches out" in preferred directions. Just as it has preferred directions, it has those directions for which it compares "poorly" to the isotropic. We can conveniently call these directions lobes and nulls.

This is all good an well, but we could compare ANY two antennas with this basis of logic. The point of the isotropic is that it presents us with a characteristic minimal and maximal signal that are equal at any point. If your hot antenna cannot achieve this (maximal) level of signal in some preferred direction - your antenna is hot only because it is radiating heat. If your selective beam cannot null out this (minimal) level of a signal - you have a real serious problem with F/B or side rejection.

I have a 989C, which I bought several years ago. It came with a "manual" that was little more than a little fold-out paper that showed what to hook, where. The on-line manual that has been available in recent years on the Web is much more detailed and useful. So I'm not sure whether the instructions that came the the B model will be at all useful, considering what came with my C model around 1993.

Having said that, at http://www.w7fg.com they have the B manual for sale.

By the way, in the on-line C manual, they got things back ass-wards on which way to wind the inductor for minimum or maximum inductance -- they say it one way, early, and another way, later.

Good luck...

In this price range, you would be much better served to look for a good used Yaesu 840, Icom 706, Yaesu FT-100, Kenwood TS-50, etc. Not only would you get ten meter coverage, you would have a much higher quality rig with all HF bands, and a much better receiver, rather than just a "warmed over" cb radio. For a few dollars more, the difference would be "night and day"...

6801. Re: Questions on HF mobile gear

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-03 19:47:21 UTC
From: DJ <kb5ylg@attglobal.net>
Message-ID: <3c0bd9d6_2@news1.prserv.net>
Source record: 51105

I happen to have both radios. I use the TS-440SAT for my base station, and TS-50 with AT-50 for mobile.
Both are extremely nice radios...I often see them go for prices in these ranges: TS-440SAT around $450 used, the TS-50 with AT-50 around $600 used. (Mine are not for sale, sorry). Check out Ebay and search on past auctions for both models and you will find out the "going" rates easily enough.

HF mobile antenna is an iffy question....depends on what you want to do. If you plan to stay on a single band most of the time, I think a Texas Bugcatcher or Texas Radio Bugcatcher (two different antennas) are best (and quite pricey), followed by a Hustler (very affordable) and finally a Hamstick (dirt cheap). If you plan to surf through the bands a lot, probably a screwdriver antenna, such as the High Sierra product.

What is a Yaesu GS23...same as the GS232?

Will it work with the same rotators? I have a GS-5500
az-el that I need a controller for, and need to determine
if a GS23 is suitable?

What is a reasonable "used price" range for GS23 vs GS232?

Thanks in advance for the tips...

I'm looking for an original rubber ducky for an ICOM W21AT.
Anyone have one laying around they'd like to part with.
Just in case you don't already know, they're Gray the same color
as the HT and they taper from a small tip to larger near the base.

Hi All,

I recently bought a MFJ1275M, Sound Card Radio Interface.

I wanted to use this "thing" in conjunction with an ICOM706 Mk1.
In the manual there were the settings for the jumpers.....
Guess what it didn't work.....
Then I went back to the retailer who gave me a new one.... (same problem
shoots again).

Does anyone has any expirience connecting the MFJ1275M to the ICOM 706
??????

Tnx for reading Gerrit, PA3DWC

Which port on the back of the radio are you using?

If it's the "data" or "TNC" port (The 6-pin mini-DIN connector), you need to enter the settings mode of the radio and drop the data rate back to 1200 baud. The AF does not go through the TNC port at the 9600 baud setting. It does at 1200.

HTH.

A solid performer, indeed! In addition to copies of users manuals
being available as .pdf files online, http://www.pryme.com also offers
"cheat sheets" for most of their radios - digesting those 60+-page
manuals into a two- or three-page text for getting on the air quickly!

Thanks. My first suspicion was that it was either imaginary or had as
much to do with ham radio as b & c did.

The 32 does have a small drain in the off position from (memory and cpu standby) . The battery will drain down (normally) in about 2-3 weeks.
I also have two of them and they both act the same. If you have two with the same trouble would checkthe quality of the batteries. The orginal BP-173 are only good for about 3 hours. I use the BP173H Nimh and get about 8 hours.

Both the IC-32AT and the IC-W32AT have the final amplifier directly
connected to the battery, not going through the switch as the switch
size can not handle the current drain when in transmit.
So you could have some issue with the PA or related components like a
bad cap on the battery line.

I have gone through 4 or 5 of Stephen's adapters over the last couple of years,
but the life span of his adapters is much better then the cheap adapters that
you can obtain elsewhere. I use the adapters every day in
all sorts of extreme environments, such as sitting in my van with my Icom R2 in my pocket.
Not a smart thing to do. Only one of the adapters failed for an unknown reason, as I was
changing
out antennas, but all of the other adapters failed because I tortured them. My whip
antennas also
wear out every few months.
The bottom line is that the adapters lost, the radio won.

Here's one. I joined Civil Air Patrol in 1964 as a 15 year old cadet. I am deeply involved in
communications with CAP doing air/ground search for missing aircraft, people who become lost
in the woods, assisting in disasters (yes, such as the Twin Towers on 9/11). On 11 September,
I was on the air the entire day, and was placed on standby to drive to NY with blood plasma in
our unit's van. Incidentally, subsequent to the 9/11 disaster and during the "hot" time when civilian
aircraft were grounded, CAP's aircraft were the only civilian aircraft allowed to fly. Indeed, the
first aerial photos of the NY and Pentagon disasters were taken by New York Wing, CAP.
BTW, it was CAP that gave my first exposure to radio and eventually led me to obtain my
Amateur license.

This is the exact same experience I had with AES in Orlando last month. I could barely get them to talk to me. I was ready to buy an antenna, but because of being ignored, and then treated rudely, I walked out. I like their catalog, but I will never buy from them.

If the relays are encapsulated/sealed, as they may well be,
try this trick. Drill a small hole in the can (care needed)
then squirt in your favourite switch cleaner (Deoxit). Allow to dry
for a couple of days then seal the hole with tape. This has
worked well for me on other radios.

>worked well for me on other radios.

That was the main point:

By chance, as working up to K16 casually closing metal pincers but without touching it, I found the switch relais suddenly retourned into resting status in a succesfully fashion. Then I discovered that metal pincers were magnetized, so I did set a small door's magnet inside the cabinet and near the small loudspeacker as located close enough to resting side for the switch relais, and then... bingo!

It is more than probably that switch's internal spring became rigid or faulty and then a small magnet near by is just counter acting or helping contacts to go back into its resting position.

No problems any more, but let's see how long it shall keep lasting and working fine!

Thank you very much indeed to all in the amateur radio newsgroups for your help.

Geeze...ever consider you might not have an email address that is
current? Email is notoriously unreliable...

Premier has a a toll-free, 1-800 number that's answered anout 50
hours/week. Always worked for me.

I hate to give up on my old TM-331a mobile 220 rig ... but it needs a little work. Althoug internal battery has been replaced, it still does not hold inputted memories, and the display enters the Twilight Zone and messes up.

Kenwood West Coast has about a 4-week turnaround time right now...can anyone please recommend a service firm that they trust?

Many thanks.

Clint Bradford, K6LCS

6842. Yaesu 817 & "FMN"?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-04 21:28:44 UTC
From: BD <bodu@pobox.com>
Message-ID: <EmbP7.562$0h1.74616@newsfeed.slurp.net>
Source record: 51146

Well.. I finally got my new toy, and the very first thing.. I find a new mode not covered by the manual and no way to get out of it, short of resetting the thing..
So what the heck is "FMN"? Narrow-FM?... It would return to that, vs "plain ol" FM, when switching to/from the other modes, but only with 2meters..
There's no reference to it, that I could locate, in the manual at all..

6843. Help! Ameritron AL-80B modification wanted

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-04 21:29:11 UTC
From: w7axe@aol.com
Message-ID: <20011204162911.11262.00001500@mb-fi.aol.com>

Hello,

Hopefully someone on here can help me with this. I am looking for the modification to enable the Ameritron AL-80B to operate on 10 and 12 meters. I have faxed my license to HRO so they would give me this info (I just purchased the amp from them new on 11/30/01) and who knows when I will get it. So, if anyone could send me the info it would be much appreciated. Please reply to my email w7axe@aol.com if you can help.

Thanks in advance,

Well, if their email address (the one I got from the PRIME site) isn't correct, then they have more of a problem than I thought they did.. The point is moot, anyway, the radio made a great target for sighting in my rifle this deer season... well worth the $100 for the satisfaction I got seeing it go into hundreds of pieces. Nice tight group inside the speaker grille at 200 yards without a scope...

I'll stick to Alinco and ICOM, and not necessarily in that order.

If it is the same as my AL811-H there was a ground wire installed in the tuned input tank for the 10-12m position which is the "AUX" band selection. This wire grounded out the input tank circuit. The "mod" is to simply cut or completely remove the grounding wire.

OK..just got info from my friend AC6AA who has the A:-80B and read to me from the Ameritron tech sheet.
He confirms it is a green grounding wire on the rear pc board that grounds out the tank circuit on the tuned input for 10-12M..have fun and maybe see you on the bands.....

Source record: 51003

>> I'm thinking about getting a new mobile/base 2 meter rig - does anyone have
>> experience pro/con with the IC-2100 H?
Yes, I have one. Great rig. One feature that is tremendous. If you
crank the squelch clockwize all the way it inserts an attenuator in
line. This means if the signal you are receiving can tolerate a
little loss it will eliminate a LOT of crossmod. I drive past one of
these multipurpose towers with 40 antennas on it, (paging, 2way, etc.)
When I do I start hearing all kinds of crap. All rigs do this. On
the 2100 I just crank in the attenuator and the signal I am listening
too comes through loud and clear, and all the cross mod disappears.

>>
>> Will it allow storage of an out of band receive frequency in memory, and
>> then allow that memory channel to be scanned?
Yes, On mine I have the weather at 162.55 stored in memory and it
scans right to it. You can also lock it out of scan.

You didn't want this one... only put out 2 watts on low (was supposed to be 7), 4 on medium (supposed to be 25) and wavered between 2 and 3 watts on "hi" (was supposed to be 50)... It was "refurbished at the factory"... and it did this since I got it. They wouldn't fix it, either.. so it made a nice target for my frustration.

Hi,

I am interested in purchasing the follwing equipment (preferrably used, but
I can consider new as well):

Daiwa CN410M cross needle SWR meter
50 ohms dummy load 50-100w
Fluke 80TK thermocouple module

Any suggestions about cheap US dealers (or individuals) selling these items
are welcome

thanks in advance

6855. IC-2800H

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-05 00:18:01 UTC
From: Ken LaCapria <ken.l@zzapp.org>
Message-ID: <3c0d6716_5@vienna7.his.com>
Source record: 51007

The ICOM IC-2800H dual band mobile radio has a setting that will mute, what they call, the sub band (the band that you are not transmitting on) when the receiver of the main band is active. However, when you transmit, the sub band is NOT muted which is very annoying.

Does any one know if the IC-2800 has a setting that will mute the sub band while transmitting on the main band? And if so, what crazy combination of buttons you have to push in order to set that feature?

Ken.

I just received my adapter from Stephen Gulyas and highly recommend
this product to anyone that wants to use antennas with BNC
connectors on any radio with SMA connectors on them.Not only is this
a great product but Stephen himself went above and beyond what one
would expect.I had made a mistake on my order to him and he went what
I consider to be way out of the way to help me out.
Steve gets my ***** award.
Mike Tesznar;
KC8RRM
They are much better than the adapters you can get at the local radio
shop.They stand up much better at the base of my HT because of the extra
support he puts on them.

6865. TS-930S repair question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-05 03:23:32 UTC
From: teaberry44@att.net
Message-ID: <7034f096.0112041923.4e450f85@posting.google.com>
Source record: 51018

I have a TS-930S that has a problem with the digital readout (It doesn't work at all). Everything else works fine. I narrowed it down to either the display tube unit or more likely IC1 which is a display driver on the digital unit board. The 930S is a early version with a S/N in the 210XXXX range.

The voltages on pins 11 to 15 on IC1 are way off as is the voltage on pin 11 of IC6 (single step not). All Vc voltages are good @ 5V with no ripple.

Just wondering if anyone else had this problem. I didn't see anything pertaining to this on the Kenwood site under repair notes. I know that all parts are available from East Coast parts in NY. I am hoping it is not the display tube as that runs about 80 bucks plus. Also, I noticed two black spots on the right side of the tube, but don't know if that is normal. I checked the voltages on most of the pins of that tube and they are running in the low 40 V range which seems to jive with the service manual.

Thanks - Tom KZ3X in PA

Not really worth the trouble. First off you would have to rebuild it and the final stages might not make it to 52Mhz. Second..you will have to "FM" it RX and TX. Next you would have to install some kind of offset osc or switching to get the 500/600Khz offset for RPTR use...and after all this you have a 4 watt rig. Do yourself a favor..just buy the Alinco 20 watt 6 meter rig..it's a bargain for the money...Eddie

hey rob
i wouldnt waste the money on converting it that HT is only an AM transserver
and there just isnt much 6 meter AM stuff
those articale you seen where to convert a SSB rig to 6 meters
and with the price of the MFJ 9406 under $300 new and under $100 used its hard
to justify spending the money to convert an old CB radio
also if you have an HF rig already tentec sells a transvert for around $150 i
think it is you can find those used as well for under $95
good luck

Refurbished ADI mobiles have come with a ONE YEAR warranty from
Premier Communications for almost a year now...

If you bought a radio imported by Premier from an authorized dealer -
then it was warranteed. 30-day return policy from your authorized ADI
dealer, and if purchased this calendar year, probably a one-year
warranty against defects in manufacture.

If you bought your unit from an authorized ADI dealer, you had
protections and warranties.

Are you being totally honest with this group regarding this problem?

Absolutely. I contacted the dealer, who is ADI Authorized. He told me to contact ADI/Pemier/Pryme/whatever they're calling themselves this week. I tried that.

The 800 number just rang and rang and rang.. All 10+ times I tried it. I tried at noon eastern time, central, mountain, and pacific. I tried around 9am in all four time zones. I tried around 4 pm all four time zones.. Nothing. Nothing for days.

Undaunted, I sent five separate emails to the company at two week intervals, trying to get ahold of someone there to let me know what to do with this "rig", which worked fine as long as you didn't turn it on. I got fed up with it, tossed it in the closet, bought an Alinco AR-135 (which I only had to turn the mic gain down on , because it was too loud. No other problems.) and now I'm happy with my mobile 2M set.

The target practice was very VERY satisfying. What the heck, it was only $100.

Amateur Radio Antennas Made By Amateur Radio Operators
Our Mission Is To Bring You Quality VHF / UHF Antennas
At A Great Price
we feature a complete line of ready to use J-Antennas. The
frequencies we stock and that are not considered
special order are 1.2 ghtz, 70 cm, 1.25 meters, 2 meters/70cm, 2
meters/1.25 meters/70cm tri-band, 6 meters, and
10 meters.
We will make an antenna for any frequency from 10 meters to 2.4
Gigahertz to fill any need.(What is considered a
special order antenna) they would be antennas for sound systems,
marine or aircraft frequencies, commercial FM
frequencies, cell phone frequencies, any antenna not listed as
standard stock ham band antennas !
Where you need a "J" antenna, we will
help!
We have sold over 9000 antennas to date !
AS SEEN IN WORLDRADIO !
STARTED MAKING ANTENNAS ABOUT 1994
THESE ANTENNAS HAVE BEEN USED FOR THE PAST 4 SUPERBOWLS, NBC
STUDIOS IN
HOLLYWOOD, ALSO CBS AND ABC...USED AT LAST YEARS MTV MUSIC AWARDS,
ALSO THE TV
SHOW , DAYS OF OUR LIVES , AND THE ROSEY O'DONELL
SHOW.
WE MAKE THE "J" TYPE ANTENNA IN COPPER, AND A ROLL UP STEALTH
VERSION, WILL CUSTOM
TUNE A "J" ANTENNA FOR ANY FREQUENCY FROM 10 METERS TO 1.2
GIG.....
SEE US AT :

The Standard C5900 does 6, 2 and 440. It's not made anymore, and
was pretty expensive when new (over $800). I bought a used one
for $600 last year.

See radio Netherlands Web page for excellent receiver reviews, including
dynamic range and intercept point numbers.

Personally i would forget the Ham radios for serious shortwave listening.
Ham radio manufacturers are behind in many aspects of receiver designs.

If it was my money, i would look at the
AOR7030
WatKins Johnston HF1000
Ten Tec 340
Kneisner Doering
The Ultimate Rohde receivers. If you have the money :)

These are serious receivers with good performance dynamic range and
intercept points. Several of these receivers have +30dbm intercep points,
something which seems to allude ham radio manufactuers. They more interested
in bells and whistles than receiver performance. The faulty designs that
Icom have brought out is getting beyond a joke. Maybe Icom thinks we all
suckers..

I have a electret type microphone from a Motorola 800mhz digital radio model number 9718. It has 4 wires, red, black,blue and green.

Anyone help me with hooking up and firing up this mic. This mic seems to have a preamp with a transistor driver, including several sot23 devices on its main board.

Jim....
If you are interested in just SWL work, I would get a decent reciever designed for the purpose. There are many options available . If money is a consideration, one of the older recievers is a good bet. My choice is the Collins R390A or the Hammarlund SP600 series. Icom however does make a decent reciever in spite of what you might read. The IC9000 is a very good reciever and for a transciever, the IC781 is real hard to beat. I personally have all the above recievers but I generally use the Collins 51S1 because it's the easiest to use. Lots of choices out there....

There were FM Walkie Talkies that were considered CB's that operated on 49 MHz, which people have converted to 6 Meter use. This is what you have probably heard of.

It's not practical to convert an AM 40 channel CB HT to 6 Meter use.

Are you an amateur? Assuming your a tech, you might want to explore the 70CM (440 MHz) band. There may be some repeaters in your area, and will have more activity then 6M. 6M is one of those bands where you have to wait a month for 15 minutes of use, but those 15 minutes are fun. Another choice might be the 220 MHz band, as its starting to get some activity.

As for equipment, there are some nice dual band (2M/70CM) radios that you can get for under $200, like the Icom W32:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1305333657

or Tri banders (6M/2M/70CM) like the yaesu VX-5R:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1304754723

If you plan on getting you General ticket, and want a nice rig that has 6M on it, look at the Alinco DX-70TH. It's a 100 W, 160M thru 6M mobile rig that typically sells for under $400 used:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1305466082

The DX-70T is the same rig, but only has 10 watts on 6M.

Hello Rob,

There are some really nice rigs out there now that cover six meters. Some inexpensive, some not so inexpensive. There's a new single band six meter mobile by Ranger Communications. It's a model RCI-5054DX. It runs a good $300 brand new though, but I'm not sure what your looking to spend. There are other multi-band radio's nowadays, but they run much more in cost. There are also many used single band six meter radio's on the market too, so you'll have to keep your eyes open for what you want. An example would be the Yaesu FT-100D or the Icom IC-706MKIIG. They both incorporate 160 meters all the way through 70 centimeters. The nice thing is they have plenty of power on each band and they operate in all modes. The downside is they cost plenty too. But when you think about all your getting they really are a good deal. You get an HF, 6 meter, 2 meter & 70cm radio all in one! But again, only you can determine what you can spend. That's where most people opt to go for a cheaper setup. But you'll have to decide. Good luck to ya!!

The most popular conversion I have seen is for a Cybernet chassis conversion
to 6m. However, it is fairly complex conversion. For $300.00 you can buy
the new RCI 5054DX and get a compact all mode rig that will do everything
you could ask for, except cost the same as an Icom, Kenwood or Yaesu......

CB's are easily convertable to 10 meter rigs but 6 meters is a big stretch.
If you want something to convert to 6, I suggest you look for an older low
bad business radio. There are still some around. This will be much easier
to convert and give you FM capabilities.

Don't know about the specs and all that, but I'd check the maximum AM filter width on the 756pro2 -- if it's in the range of 6 kHz, the audio may be a bit tightly constrained for full-fidelity broadcast listening. My NRD 525 has bandwidths up to 6 and 12 kHz, and I would assume the NRD 545 does, too.

Also, the 756 does not have the kind of synchronious tuning for AM that minimizes fading, so a strictly swl receiver with synchronious AM tuning would probably be better, regardless of how good the 756 performance is.

Best regards,

Bob

Regarding six meter activity --

There is plenty of six meter activity. The past three or four weekends the band has opened up very nicely, from Michigan here to Alaska, Hawaii, and even into Europe. A friend of mine worked a number of stations in Europe over the past two weeks. That's all on SSB.

On FM, there are a number of places to find activity, such as 52.525 simplex. I monitor this frequency all the time, and over the course of the last couple of years have worked 20 or more states right there. There are also repeaters on six meters around the United States.

For me, six meters is my favorite band. I enjoy all modes, mostly AM and SSB, as I have a number of vintage rigs I like to get on the air. They call it the "magic" band, and over the 8 or 9 years I have been using it, I can certainly agree with that.

Hi Gang,

I'm selling my Heil Goldline GM-4. Don't use it. The mic is in excellent condition, and comes with the original box, and documentation. $100 split shipping from 55109. If interested I can be contacted at n0kq@arrl.net

Thanks,
Nick N0KQ

6904. For Sale 10 meter rig

Maybe I need to clarify myself... ;)
I know lots of people who enjoy working 6meters...
I was mostly wondering why a beginner's wanting to 'go there right off the bat' before even getting a license..... It's a fun band for some, sure..
But if it's challenging for old-timers, well....
Sort of like going down the "killer-slope" before even trying the bunny-hill..

6908. Re: CB convert to 6meter?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-05 19:34:33 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <9ulssrrbe1@slb1.atl.mindspring.net>
Source record: 51062
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I started in Oscar Satellites with an automated Station consisting of a FT-736R, Kansas City Tracker/Tuner computer interface, KLM Twist Oscar antennas with polarity switchers, and a 6m module added to the FT-736R. By coincidence, I decided to try 6m one day during an opening and contest, occurring simultaneously. At the onset, I didn't even know what a grid was. I knew my Lat/Lon, and soon discovered it was a rare grid due to over 75% being in the ocean. Add that to the fact that it hadn't been represented by any active hams in quite some years. Over 2 hours later and 150 contacts, I managed to clear the first pile-up. Considering how nearly impossible it would be to experience the same "popularity" on HF within the CONUS, I can only say that 6m is the magic band and one that helped me "cut my teeth". I soon found that Satellites were more boring than HF, although more dependable for keeping skeds. I then moved onto weak signal terrestrial work on SSB and digital formats. It is hard work, requiring an understanding of propagation, weather fronts, proper antenna installation and orientation, coax loss at higher frequencies, proper grounding and RF shielding and demands courteous operation at all times. I soon found that the "Cream" did surely "Float to the top", as the best operators were above 50 MHz. However, your mileage may vary; you may be content to only work HF due to the minimal amount of effort necessary in setting up a station and the fact that you will make more contacts by mistake that you would make on purpose above 50 MHz. There is a lot of this going around, and it's affect on the hobby is becoming more increasingly noticeable......

In other words, Shoot High, accept nothing less and help preserve the future of Ham Radio by keeping abreast of technology and finding new ways of communicating effectively. BTW, you won't find this on HF, and it is unlikely you will make a big difference by relying on the repeaters.

If you are serious on converting CB to 6m, I have a few mods here on file that are quite complex, but are supposed to yield satisfactory results. If you feel that you will enjoy 6m AM operation, I would recommend the RCI 5054DX, due to it's design incorporating High Level AM Modulation, and the ability to have the dual output section operate in a true linear fashion by modulating only the Driver on AM. SSB reverts back to AB1 and the AM Audio quality should be heads and shoulders above the regular approach to AM by the other manufacturers.

You can also look for HF offerings to be appearing soon in the American market, based on "Export" chassis 10/11m rigs with either one more or one less stage of up-conversion to put them in the Ham bands. I know Maycom has a 40m rig out slated for sale under $300.00 and it incorporates the same design as the RCI 6m rig does. This is one of the benefits of the efforts spent to police 11m with valuable Ham Radio assets; the influx of affordable

gear into the Ham market by manufactures who had too much invested in their production process to shut down due to outside pressure. I couldn't say if these will be as "tight" as a Kenwood/Icom/Yaesu; but at 1/4 to 1/3 the price.....

Source record: 51064

Was wondering if such a thing is sold. Would like to set it to UTC in the 24 hour mode. Was wondering if the atomatic clock set function would work considering that from the advertisements that I've read they only appear to work in the continental U.S. Will setting it to a different time zone than PST affect the performance.

Thanks,

Jim Keller

I have a SkyScan Atomic Clock.
I can set it to any time I want. However once it receives the signal from WWVB it resets to that reference. There are time zone references that are switch selectable. However, they are for PST, MST, CST, and EST.
Maybe if you sourced one from Europe it would have the time zone setting that would allow UTC, GMT (I doubt it because they don't have the WWVB reference signal in their area) Or maybe we can find someone who knows how to change the references inside the clock.

> I contacted the dealer, who is ADI Authorized.

Was this within a 30-day period?

> ...ADI/Pemier/Pryme/whatever they're calling themselves this week...

I still have problems believing you due to your poor attitude. But
that's MY problem.

Premier Communications is - and has always been - the 'parent'
company...ADI has always been an overseas manufacturer/factory of the
ADI amateur radios. And Pryme is a tradename for Premier's
accessories. Premier Communications doesn't change their name
often...they're quite stable.

> The 800 number just rang and rang and rang.. All 10+ times I tried it.

I have no idea what your problem is. The publicly advertised 1-800
number has been available to anyone in the continental U.S. for years.

> ...I sent five separate emails to the company...

We can stop this thread now. You cannot properly dial a telephone
number - that is very obvious. I need no further input from you.
Sorry you had a problem.

To be more specific, look at the model ET-31BD (at atomictime.com in the wall clock section) which can be set to 12/24 hour format and has dual clock displays. I set the top clock to local time (-6 for CST) in a 12 hour format and the bottom display for UTC (-0) in a 24 hour format.

6918. Re: TS-930S repair question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-05 23:19:13 UTC
From: John Klewer <jklewer@directvinternet.com>
Message-ID: <3C0EAB71.3E22E793@directvinternet.com>
Source record: 51072

Check to see if the -30 some-odd volt inverter power supply is operating.....I have found several 930's with circuit board plating problems in the area of the digital board along the edge of the board adjacent to the little transformer which, when re-soldered, made the display come back.
This is not to be confused with the ever-present plated through hole problem on this board which will make all sorts of wacky things happen, at any possible operating temperature.

This problem is actually that the solder coating on the copper traces has some sort of oxide layer between it and the copper and connections are not made as expected.....very wierd!

Hope this helps

John, N6AX

Maybe they were having phone line troubles that week? Who knows. They should still have answered their email... which they didn't.

>
> > ...I sent five separate emails to the company...
>
> We can stop this thread now. You cannot properly dial a telephone

> Sorry you had a problem.

You make assumptions based on nothingness. I've been dialing phones longer than I've been on the radio, and that's well over 20 years. Maybe not all of that was in Amateur radio, but I did at one time hold a CB license...

But you're right.. we can stop this thread now.. Your "crotchety old man" routine bores me.

Try this url:
http://listings.ebay.com/aw/listings/list/all/category4670/index.html

Once there, click on the "transceiver" section.

And just browse through the listings. The other day I saw an old Icom 6-mtr only all-mode rig from the 80s that was going for a song. Just browse and look. It's a good way to familiarize yourself with the older rigs, and you may find something just right for you.

My introduction to 6 meters was a homebrew 5-watt AM rig hooked to a 6-meter ground plane. Very exciting when the band was open. And when it was not, there were locals to talk to.

Or, if you just want 10 meters, buy a Realistic HTX-10,
save yourself some money, and not blow hash all over the
band like you would with an RCI. Somebody in this group
has a used HTX-10 for sale for $75. I had the older
HTX-100 and it was a nice, simple rig. I worked dozens
of countries from my car with that thing...

Jim,I have two atomic clocks from www.shoplifestyle.com ,one set to local time and the other to UTC 24hr time.They work wonderfully well and have a huge display.The UTC clock resets at midnight UTC which is 7p.m. local time which has never been a problem even in the summer when it's still daylight at that time.The only time they have failed to receive the time signal is when there is a thunderstorm within about 150 miles.The clocks cost $39.95 each,model# FWS889.Hope this helps.Frank

Hello, from Plano.

I was in Texas Towers just yesterday, and took a friend with me who just passed his Tech, and we both felt like we had done something wrong by stepping inside their business. That killed the excitement of a new license in a hurry.

I've been to TT a dozen times in the three years I've lived here. I can't say I've ever had a pleasurable experience. I guess I keep thinking it will change.

73,

Jeff - KB4YKQ

I have a GE Master II repeater, currently on government frequencies,
that I am getting coordinated on the 70CM (448.xxx) band and will need
to recrystal it for whatever freq's our coordinator assigns. GE calls
them Integrated Circuit Oscillator Modules (ICOM) and I need the "2C"
type, GE# PL19A137763Gxx. Anybody know where I can get them?

Rob,

You are exqactly right, so don't let other's comments get to you. 6 is a great band. Good DX possibilities, virtually all modes, small antennas, and available radios for modifications and home brew projects. The only thing you have to watch out for is TVI. Its right beneath channel 2 and you can easily cause problems with neighbors or your own TV.

Have fun with it. That's what this hobby is all about.

Wow! And, I was on the verge of buying the 40 footer... Hmm, maybe I'll
just cook up a homebrew instead and save a few bucks...

Hi:
I've got a Yaesu FT-212RH modile 2m transceiver in very good
condition that I'd like to sell. This radio was only used for a
short time to play around with packet in the shack and is clean
and smoke free. Specs are:
144-148 MHz
5W and 45W output
LCD display - backlit (orange - variable brightness)
18 channel memory
scanning & priority channel
(mic not included - was used only on packet)
$110 US shipped in NA

Bill, VE3EC

Same experience here too when I was visiting Texas Towers in the DFW area a few years ago. Hell... if they don't want people visiting them, why not lock the door?

Shouldn't be a problem around here; KDTN ch 2 is educational
programming, and you couldn't force most Dallasites to do anything
that might improve their minds.

I have a TS-570D/G as well, and it makes full power on 160. I can't imagine a reason for a menu choice to lower the power, when there is a dedicated button on the front panel.

One can usually have the existing channel elements "recrystalled."
Either way, http://www.icmfg.com or http://www.jancrystals.com
can get you on the road. ICM has even paid for used channel
elements in the past, and they did a perfect job recrystalling those
for my old GE Mastr II radios.

Enjoy -- Mark

If there are no screws, I'd imagine they are pull-off knobs. Either that, or you loosen something from the back of the face plate.

Mine works perfectly on 160 - as well as the other bands - in fact, since the "G" mod, I get 110-115
watts out on all bands...

Some overseas versions are limited to 10w on 160 by their countries rules.

So what? Why does all that force them to be rude?...
The few times I've walked in there, they weren't exactly "manning the
phones"..
They were sitting in the back (of the showroom) talking to each other,
reading mags, or whatever.. Not taking phone-orders, or anything else which
they'd be loosing $$ on by taking the time to wait on me properly...

Hello all. Is there an e-mail reflector or any other web reources for the users of Atlas transceivers? I was told of one on Yahoo but haven't been able to locate it.

I'm interested in any info, mods, etc. for the 350 XL.

Tnx, Tom

Rick:

I'm amazed by the nonsense replies you got on this one. Those
responders apparently have a fuzzy understanding of transmission lines.

In fact, the answer to your question is that it would not be. A 50-Ohm
cable connected to a 50-Ohm load will deliver 50 Ohms at the opposite
end regardless of its length.

... Rich

6957. Will the FCC permit Kenwood Sky Command?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-06 23:22:34 UTC
From: Bob <nospam@hotmail.com>
Message-ID: <_4TP7.726$hE.607289@paloalto-snr2.gtei.net>
Source record: 50961

Many of you may not be aware that the FCC, at the urging of the ARRL, has interpreted the rules to prohibit Kenwood's Sky Command HF remote control system, and any other systems that use 2 meters for any purpose in this context.

The basis for this is a rule that excludes auxiliary operation on 2 meters, even if there is only audio and no control signals on this band. This rule appears to have been originated many years ago based on the fear that bands in the VHF region will not support the amount of traffic that certain "auxiliary" systems of that day might generate.

Arguments go back and forth debating whether two meters is too crowded or not. Those in large urban areas tend to see two meters as having no available capacity, and those outside of big cities tend to see it the other way around.

My own opinion is that good amateur practice has resolved these types of problems within the amateur community without the need for over regulation. A good example is repeater coordination which is done strictly within the amateur community.

I would like to use the Kenwood Sky Command system in a rural area where there is virtually no simplex operation to be heard for weeks on end. But I can't due to the geographic breadth of this rule and the FCC's recent interpretation. Even in Urban areas, my experience is that the crowding is on the repeater channels and that the simplex channels, the ones the Sky Command system would use, go without much use, except on the most popular simplex frequencies such as 146.52, Etc.

It seems to me that a rule aimed at over crowding, probably in a large city, has no business limiting the use of frequencies where over crowding doesn't exist. In addition, the Kenwood system allows for turning the 2 meter base transmitter on and off from the mobile. There is plenty of opportunity for monitoring the frequency before it is used, as is good amateur practice.

Kenwood has proposed that the rule be changed and the FCC has put it out for comment. Due to the lack of publicity, and the complexity of the FCC's electronic comment system, there haven't been very many comments to date.

The following link is to the FCC's electronic comment area on the Internet where you can read comments from the few amateurs that have figured out how to navigate the FCC's system.

http://gullfoss2.fcc.gov/cgi-bin/websql/prod/ecfs/comsrch_v2.hts?ws_mode=retrieve_list&id_proceeding=RM-10313&start=1&end=29&first_time=N

If you would like to add your comment, the link to do so is:

http://gullfoss2.fcc.gov/cgi-bin/websql/prod/ecfs/upload_v2.hts

The proceeding number is RM-10313. You must submit your cover page after filling it in, and then either upload a pre-written document, or use the link at the bottom of the page to go to a blank form where you can make your comments.

Lee,

Yes, SWL (Receiver) is my interest.
Then, thinking of IC-756PROII (very later).
IC-9000 have nice specs (and terrible price).
Thank you for the tip.

No comments on those Bert..but have you checked out the W9INN line of wire antennas? I host the W9INN Antennas web page on my web site which is listed below....

One of the most popular W9INN models is the MPD-5C which is a 5-band (10,15,20,40,80m) fan dipole with resonance on each band. It is also rated for 1500w pep. I have 299 DXCC countries on mine so far!

It employs what W9INN calls "resonactors" which act as a type of trap ...however there is no physical capacitor component in the antenna..therefore the 1500w rating is easily achieved and as such these "resonactors" are extremely reliable...

6964. Yaesu FT-100D vs Icom IC-706MKIIG Comparisons???

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-07 02:31:51 UTC
From: Jeff Baker <jabake3@yahoo.com>
Message-ID: <9up9n0$1sd$1@slb2.atl.mindspring.net>
Source record: 50968

Hello, all, from Dallas, Texas!

I've looked through the newsgroup for this question, but seeing none, I will ask...

I'm finally ready to upgrade my mobile rig from my Kenwood TS-440S to either the Yaesu FT-100D or Icom IC-706MKIIG.

I've been reading up on them both, and ARRL's Product Reviews seem to give Icom the nod.

But I'm sure many comparisons have been done by other hams...

Any thoughts or other articles or websites to peruse???

Thank you.

73,

Jeff, KB4YKQ

Hi Guys;
I have for sale a Really nice, better than Excellent Swan 350.
I borrowed a supply from another rig to test it out.
Puts out 100+ to 175 watts depending on band!
No Chips or scratches to speak of! It was dusty & not used in years so I brought it up on a variac & was surprised that it started hearing stations at about 70-80 vac, She's Alive ;-)
S/N is C 843675 and is 100% complete & original except for just 1 cabinet screw!
Here are some pics to view>>

Joe,
I got a kick from your response - had to send a copy of this to my
brother who lives in Dallas. Hope he can actually read it - he's a
teacher in the Dallas Unified School District 8-}

That being said, I operate on 6 meters quite a bit and live in the Los
Angeles area, typical urban congestion. Have had absolutely no
complaints about TVI - and being the only house in the neighborhood
that is festooned with antenna's I'm sure if the neighbors had
interference they would know which doorbell to ring.

Source record: 50974

> A 50-Ohm cable connected to a 50-Ohm load
> will deliver 50 Ohms at the opposite
> end regardless of its length.
============================
Indeed it will. Unfortunately an antenna seldom has an impedance
of 50 ohms.

For example a 1/4-wave vertical has an impedance of around 37 ohms
and a 1/4-wave coax 50-ohm line transforms it up to 67 ohms.

At the centre of a 1/2-wave dipole we see 75 ohms and a 1/4-wave
50-ohm line transforms it down to 33 ohms.

If A and B are two impedances to be matched then a 1/4-wavelength
of line of impedance SqrRoot(A*B) will do the job.

On the other hand transmitters and receivers (and their users)
seldom notice the relatively small departures from the 50-ohms they
work best into.

First, there have been hundreds of posts on this subject in the past. Try
http://www.google.com/grphp?hl=en and search for FT-100 or IC-706, etc.

Personally, I have owned an Icom 706 Mk II as well as a Yaesu Ft-100. I
sold the Icom a week after I aquired the Yaesu... :>)

By moving the jumpers that determine the model you should be able to make it work correctly. You need a service manual to locate the jumpers and it also has a chart showing the configurations.

But thats dealing with phasing. IE: adding an extra 1/4 wave to run another element 90 degrees out of phase. They are referring to impedance. There should be no change in impedance with changes in length. 2 ft, 9 ft, 429 ft, shouldn't matter. The only thing that should happen is a lower SWR as you get longer and longer due to the losses starting to build up if you had a mismatch between the antenna and feedline. If you note changes with length of coax, you would have a common mode problem and have rf flowing on the shield. To make a transformer, you would use a different value coax set up as a series section, or as a stub. Having a 1/4 jumper of the same 50 ohm coax as the feedline is just addding to the whole feedline length. It shouldn't act as a transformer. MK

Try e-ham, and the deja-google. Should be loads of posts in there
somewhere.
Which do I like better? The 706g. Why? Cuz I have one..:) I've never
been able to try a ft-100 yet. They are both decent rigs by what I
hear. Probably user pref more than anything..I'm just kind of an icom
man...Seem to be a a tad better built to me. A little beefier, etc. As
an example, the 706 is 100% duty cycle. The ft-100 is rated 50% from
what I can tell. Thats just one thing that swayed me... MK

Hmm.. That's not been my experience...
If the email-address wasn't current, it would most likely "bounce"... Else,
someone's server's probably getting awfully clogged with 'em by now...
What's happened, I'd bet, is that they hired someone to do the website and
"yeah, yeah, yeah, we'll answer the emails oursaelves," but have forgotten
to do so... Email is normally VERY reliable... It's the operators who
often aren't...

I don't know about the Radio Shack stores in Texas, but the Radio Shack.Com in my area sells Amphonol pl-259 silver connectors. They might cost a buck or so more, but they do appreciate me visiting their store.

Even the local Ham Radio Outlet on the other side of Phoenix from me is happy to help me when I walk into their store. Even visiting the HRO store in San Diego, the manager there was great to talk with, even though I couldn't find a thing I needed that day.

But if the people at TT like having the personality of a door knob..... so be it.

You must realize that the overnight also has no protection whatsoever. It is gone and the seller ahs it and you have NO recourse. On the other had, with Pay Pal if you fund it with your credit card then you have the same charge back rights as any other credit card. Furthermore, if you fund it with instant transfer that if you sent to a verified address that you have the seller protection up to 200 dollars. On top of all of that it is INSTANT and it is FREE.

As for the requirement to upgrade to accept credit card payments, you did not really think that they would continue to absorb the charges of the credit card companies, did you ? If so, you are more naive than I thought.

I have used Pay Pal for years with absolutely no problems whatsoever. I feel that this thread is from a user that had some kind of problem, perhaps of his own making and he is trying to blast pay pal with no reason.

None of these have ever said pay pal scammed anyone only that hey follow the user agreement that YOU DID READ DIDN'T you and therefore you have no complaint.

I have NO connection with Pay pal, just a satisfied user.

Consider yourself lucky, but you're still playing "Russian Roulette". I had PayPal post a fraudulent charge to one of my credit cards THAT WAS NOT EVEN LINKED to their service. When I contacted them about it, they had NO RECORD of the charge.

Fortunately, my credit card statement reflected the PayPal charge, and after filing an avadavat of fraud with the credit card company, the credit card company reversed the charge. I promptly canceled that credit card, and removed all of my accounts from the PayPal service.

My advice to those who still use PayPal is to pay very close attention to ALL of your account statements, and compare the PayPal statements to your credit card statements (even those cards that are not linked to PayPal). If you should incur a fraudulent charge from PayPal, their records will not show it, but your Credit Card statements will.

My display went bad. I suspect many others go bad, too.
There are vacuum florescent displays and perhaps the seals go bad.
The real bad news is that I have not found a replacement source for these
displays.
If anyone has a source, please let us know!

In the meantime, I've rewired my display to feed a stacked cluster of 7
segment LEDs
Good luck
-dave

Reg, of course, you're also correct.

I thought, however, with the misunderstandings we're seeing here, it's best to stick with a straight answer to Rick's question/observation:

IF the cable is 50 Ohms, and IF the load is 50 Ohms, then the length of the cable is irrelevant.

As you suggest, if the "IF"s are way out of wack, then we can do "magical" things by fiddling with the length of the line. :-)

I still miss the easy operating of my old ic-730 sometimes compared to
the 706. It pooped out on me, but I still keep it hoping to find the
part I need so I can fix it. The 730 is one of the easiest rigs to
operate while driving I've had. The 706 is not exactly simple while
moving being it sits on my seat next to me. I can't turn and deal with
it while driving until I can get the faceplate mounted in front of me.
So I try to set the 706 up to be pretty much "preset" so I don't have
to jiggle thru the menus while driving. But saying that, I'm still
quite satisfied with the 706. It's been a pretty good rig so far. MK

Why would you think that that's spam? The definition of spam, as I remember it, is someone advertising something that's not appropriate. Now, if I thought I could offer something to someone that they were griping about from others, I'd probably go ahead and offer too. This guy was certainly being honest, saying that he probably wasn't the cheapest, so I don't think he was lieing. Maybe you should rethink your definition of spam?

Source record: 50912

Yaesu VX-5R triband handheld transceiver for sale. This unit is in
excellent condition, with original box, manual and accessories.
Approximately one year old. Original belt clip has been replaced by
spring-loaded Motorola pager-style clip; it holds onto belts
very securely.

Additional accessories I purchased for the radio include:
Speaker/mic
soft case
ADMS-1E programming software and cable
(These alone are worth about $90).

Asking $240 (shipped) for entire package. Email rjchen@stanford.edu if
interested.

Hi,

I've just purchased a FT-817. Very nice toy, althought my first impression is that the NB is not very efficient. Anyway, since I do not buy the rechargeable NiCad Yeasu batteries, I would like to know if someone have tried to make one battery pack by their own. I would like to make a NiMH pack.
Yeasu documentation tells to not try to put rechargeable batteries in the FBA-28 holder because there is no protection. Does somebody know what protection ? How is designed the battery pack FNB-72: any diode for protection, or fuse ?
THanks for any help.

Hello Olivier,

I have seen on the reflectors for the FT-817 that hams are purchasing those Universal Camera Battery Packs,
that have NiMH Batteries and making an adapter for the radio. They also connect a tuner, and small amplifier as well.

THERE'S *theoretical* electronics - THEN there's *real-life*, PRACTICAL electronics!

We have seen a number of antenna types (bazookas, coax flattops, etc) using various lengths/types of
coax in their construction that are used to "magically" transform - or trick - the apparent resonance and impedance of the system into something other than what it would ordinarily be according to theory and materials and dimensions used.

The effect of demonstrated - or apparent - resonance and feedpoint impedance is easily demonstrated
on VHF/UHF, where the simple act of altering the coax feedline length by a mere foot or so has the
APPARENT effect of significantly altering the resonant frequency - and the IMPEDANCE along with
it - of the system in use. *I* did it as recently as last night on 2 meters, when installing a new
SWR bridge in line to the VHF output of my Icom 746 - the SWR went CONSIDERABLY higher as indicated
on both the bridge and the indicator on the 746 with the change I initially used in the installation - yet NOTHING in the antenna itself was in any way changed. Trial and error with
different short lengths of interconnecting coax, as it has ALWAYS done thru the years, soon restored
APPARENT low SWR at the operating frequency I was wanting best match in the system. So what IS the
actual, TRUE resonant frequency of my 2 meter antenna at 50 ohms? I really don't KNOW - but I *am*
able to make my transmitter THINK it occurs at 144.200 simply by careful selection of FEEDLINE
LENGTH - and can as EASILY make the SAME antenna APPEAR resonant at 50 ohms at 146.500 - just as it
did when I first connected the new SWR bridge that changed the feedline length!

NOW, that ain't "scientific", or strictly according to "theoretical antenna engineering" - but IT IS
easily repeatable and demonstrable in REAL LIFE APPLICATIONS, and proves well enough to ME that the
APPARENT and USABLE impedance and resonance of an antenna system CAN be (artificially perhaps!) be
manipulated and altered by the simple juggling of coax length that SHOULDN'T (in theory) have ANY
effect upon either resonant frequency OR impedance of the system!

You may quote theoretical electronics to me all you wish - but *I know* what WORKS in actual

practice, regardless of technical bafflegab that might be used to explain it away or render
it
irrelevent!

7025. ADI HT-204 crossband repeat

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-08 18:03:03 UTC
From: woodhull@wilde.oit.umass.edu
Message-ID: <3c1255d7$1@oit.umass.edu>
Source record: 50929

I'd be interested in hearing from anyone who has used the ADI HT-204 as
a crossband repeater. Experience with the AT-600 might be relevant, too,
I think they are very similar.

I've figured out how to get the unit into crossband repeat mode so
I can connect it to a good antenna that gets into my local 2-meter
repeater well and wander around the house with an older 70 cm handheld
listening and talking on a simplex frequency. But the HT-204 doesn't seem
to send CTCSS tones in crossband repeat mode nor does it relay them
from the handheld, as far as I can tell. So, apparently I can't crossband
repeat into a repeater that uses tone control.

Another question is how to gain local control when the 2 m. repeater
is occupied by long winded users? While the HT-204 is repeating it seems
that all the keyboard controls only generate DTMF tones, I can't find a
way to make the HT stop repeating, short of disconnecting the 2 m. antenna.

Also, I'm wondering if it is possible to somehow inject an m.c.w. ID into
the system. It looks to me that leaving it repeating when I am just
listening in means it will be transmitting on the local 440 link without
any ID.

Any hints would be appreciated.

Thanks,
Al N1AW n1aw@arrl.net

7026. RF keyless entry

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-08 18:04:47 UTC
From: tj <tj559@hotmail.com>
Message-ID: <9utkq7$t2j$1@slb2.atl.mindspring.net>
Source record: 50930

How do *most* car RF keyless entry systems work? My 93 T-bird for example. I'm not out to boost someone's car, I'm sure the low tech approach of using a slim jim or breaking a window would be more status quo anyway.

Is it just a low power carrier, if so that would be supper cheesy. I would hope that theses more to it than a freq counter could crack.

7027. ICOM R8500 control software (need help)

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-08 18:06:31 UTC
From: email <gred@libero.it>
Message-ID: <HEsQ7.265054$sq5.12941116@news.infostrada.it>
Source record: 50928

Hi there,
I'm trying to write down my own program to control the ICOM R8500
receiver.
When I send commands to the receiver everything is ok but I don't understand
how to decode the string received back from the receiver (indicating the
frequency).
Hereunder some examples:

Frequency set String value received
(header & closing chrs not reported here)
0.100,00 001000
0.100,02 ...2001000
0.123,45 ..50341200
1.000,00 00010
1.002,34 ...4023010
1.234,56 ..60452310
10.000,00 000100
12.345,67 .705634120
73.918,02 .208091730
100.000,00 00001
123.456,78 .806745231
1000.000,00 000010
1200.000,00 000012
1200.000,23 ...3020012
1234.567,89 9078563412

The string received back has a variable length, so the first thing I do
(after cutting header and
closing chrs) is to 'normalize' the string to 10 chrs length;
i.e. for 10MHz I receive back "000100" then I convert it to "0000000100".
After that I need to translate this string to a string (num or chr) that
rappresent the
real frequency (!) and here... I need some help....
I'll appreciate if someone could give me any suggestion.

Thanks and best 73s, Giovanni.

Yaesu "protects" their own battery pack with the "green wire". This taps the battery pack at midpoint. This "signal" then goes to hardwired smarts in the power management circuitry within the FT-817. You can install rechargable batteries in the battery tray provided, but they will not charge from within the radio. However, if you remove the green wire, they will then charge as long as the radio is connected to an external 12 vdc source and you have set up the "Charge Time" option available as one of the menu items. No, there is no protection. Many hams are installing a mini-fuse in series with their own pack. This is a wise move, but I have not done so. Actually, I would recommend adapting the connector on the Radio Shack 9.6 volt NiMH battery pack to the '817. It is sold by RS for use in miniture racing cars and comes in at 1600 mA-Hrs. I also tried installing rechargables in the battery tray that comes with the radio. Under heavy current drain, the batteries exhibit too much resistance between their contacts. They are not held together tightly enough in the tray provided by Yaesu. The spring constants on the conical springs at one end of each pair of batteries is not adequate and fatigues relatively quickly. With the RS pack, everything is welded together so there is no chance of developing a resistive contact and the pack is nicely bound up in PVC or some other kind of shrinkable plastic wrap. In addition, the RS pack leaves a little more room in the battery compartment than does the Yaesu-provided battery tray.

That is one of the great things about the W9INN MPD-5C is that it has
resonance on all 5 HF bands (10-15-20-40-80m) and is rated for 1500w PEP

I do not use any tuner at all after the AL-811H.....and simply use
the auto-tuner of the TS450S to touch up the match to the input circuits
of the amp...simple and very effective....

If you look at some of my posts on this newsgroup, you will discover that I have worked in the industry. Two friends of mine owned an internationally known 800 number and walk-in ham retail business. I worked full time in their commercial division and part time in the amateur division. I've had dinner with Icom, Yaesu, Kenwood reps and Mr. MFJ himself. I know a little bit about the industry. I wouldn't own a ham radio retail business because of my knowledge of the very low profit margins and the huge volumes of equipment that must be sold. The store I worked for was a single location.

The other stores you have mentioned are multiple store chains, with the exception of Texas Towers, another single store location. Since a reasonable profit is difficult to make unless one sells a terrific amount of product, I can understand Texas Towers inability to provide super detailed and gratifying in- store service, if such is, indeed, the case.

Just because you do not like a situation, does not mean that the situation is untrue. It is a cut-throat business with little room to err. The phones ARE the business and the walk-ins are a PITA unless you move tons of equipment. As I said, I did not create this business model, nor did TT. They are the victims of it, just as are their customers.

The owners have since sold their business to one of the chains that have been previously mentioned and have reinvested their money in financial areas that do not require that they work seven days a week and put up with the typical PITA ham crowd. They even smile once in a while now. Good for them.

As a former amateur dealer I can vouch for the "PITA"
walk-ins. Most would come in, take up your time, want to BS,
look and paw at everything- then walk away and order
what they wanted by phone to save sales taxes. If that
was not enough, they'd come in later with the rig they
bought elsewhere looking for service and get upset
because you only serviced what you sold. After
enough of this one tends to get a bit cranky with some
types. The "chain" houses end up winning because they
get better deals from the manufacturers.

My selling days ended 20 years ago and I am utterly
astounded there are any amateur radio dealers left.
There's nothing to prevent the manufacturers
from selling direct at whatever prices they wish to charge,
The only thing I can figure is that they serve to isolate
the manufacturers from the those who buy the stuff.
Its obvious they know the "pain".. and are willing to
sacrifice some profit and let someone else absorb it.

My Uncle Bill Schuster, owned Warren Radio in Erie, Pennsylvania, and it was eventually a considerably larger multi-outlet operation in Pennsylvania, New York and Ohio. That level of the organization, under his dominion, produced one very firm observation about counter sales he shared with me more than once. (Grin) He also finished with a SUBSTANTIAL contribution to charitable efforts, and no distribution of any assets to anyone else in the family, thank you, for which our family is terribly proud. Take a walk through the Schuster Gallery at Gannon College or the Performing Arts Center there, the Erie Philharmonic, and countless other targets of his financial affection. Uncle Bill's remark, "Heck, I've gotten so much from Gannon I have to put it back!", was dead on. You have to put it back. You have to put it back.

Thus, I too ..

>I know a little bit about the industry. I wouldn't own a ham
>radio retail business because of my knowledge of the very
>low profit margins and the huge volumes of equipment that
>must be sold. The store I worked for was a single location.

>Ed Cregger
>nm2k@arrl.net

share some of this knowledge and ... respect.

I worked within the store at this 50's and early 60's time frame. As well, my Grandafather Max was counter help in the Erie store for MANY years. He was the first person I'd ever met with tri-focal glasses! Had to have them to work with the tinsey details for parts work ... grin! Not bad for a man who came to the USA as an immigrant and whose first job was to PULL the fire engine, until they got horses for it, after which he was promoted to a pumper!

For what you say today of the below, Ed, is still today,

>Just because you do not like a situation, does not mean that
>the situation is untrue. It is a cut-throat business with
>little room to err. The phones ARE the business and the
>walk-ins are a PITA unless you move tons of equipment. As I
>said, I did not create this business model, nor did TT. They
>are the victims of it, just as are their customers.
^^^^^^^
dead on.

Even back in the 1950-60's, I can't tell you HOW many times I have been chewed out, "MIKE! If you have to take more than ten minutes with a

counter customer, we are BROKE! BROKE, Mike, BROKE! Same from my Granfather too, smile!"

The statistics on WALK-IN traffic, per the actual figures back in the 1950-60'ish arena were VERY specific! If a person who walks up to the counter takes more than TEN minutes to handle for a sale, you lose money on that sale. On average.

And, as a Novice in 1952 as WN5WQN, and at age 13, I couldn't, for the life of me, understand that, try as I might, about, in particular, the HAMS! Grin! It was too much fun to talk with them!

You see, it is our diversity as a group that makes us so intriquing as one, and to each of us within the group, is also our downfall as to profitability for those who supply us with the tools of our trade!

If WE were having to write checks or pay bills for the hourly time we spend at the target of our affection here, I betcha there'd be a somewhat different perspective about how WE shop and find favor or not with our suppliers! Heck, we get thousands of hours of service out of aa $500 rig, right? Chuckle!

But we don't write the checks for that! And further, very, very few of us ever wind up writing the checks and paying for a professional relationship with the field we, as amateur radio operators, are in. Thus we really never get to see the reason for what Uncle Bill and Grandpa kept telling me over and over again! That ten minutes used to be a pain to me, smile, but in a different way of looking at it! I was forever mad at having them cut me off from, taking time to ... Well you get the idea!

And of their point of view?

It took me a long, long time to ever get to understand that. And, now, I genuinely do understand both sides of the issue! Even at that time there was division within the professional house there! Per recall, a gentlemen by the name of Mace, split off from Warren Radio, those long and many years away, and took ... a rather substantial part of the ham radio business with him. But it too, I think, isn't strong even today, in these, the lowest level of profit margin operations, in the business. The competition is FIERCE and has VERY little bottom line margin.

You see, what we really need be thankful for, is that there still ARE the Texas Towers type of operations as well as the AEA's and all the rest. We are .. as a group, so fortunate to still have a CHOICE at all this. It takes all kinds of folks to both make us up, to deal with us. Each of us has a special unique part of us that forms our personalities and how we work with others. And they with us! There is plenty of room for all of us and, fortunately, the kind of relationship we each want in a vendor.

As you might note here ... Mikey is not part of the family electronics business either!

Huge grin!

Per Uncle, "I don't think that would ever work. You take too long with sales, Mike!" Yep! Takes all kinds doesn't it?

All this is kinda like the banker who buttonholed his account and said, "Do you know what you are doing? This is called kiting checks!" The client said, "Yes!" The banker then asked, "Well what are you going to do about it?"

The client said, "Find another bank!"

Happy holidays! Bigger toys for Bigger Boys and Girls!

--> Sleep well; OS/2's still awake! ;)

I have a FT-902DM that is working fine except that the AM mode receive doesn't work when the AGC is turned on (either fast or slow). When the AGC is turned off the AM audios can be heard. When the AGC is turned on the S-Meter needle is moving but nothing is heard. Any thoughts or help ?? Thanks for your time.

Pedro,
Does this happen on all bands or only some? Lift filter board and
examine relay solder connections carefully. Re-solder any that look suspect.
This is fairly common on the 140, especially later production.

I didn't say that you couldn't make money. I just said that
you couldn't make "enough" money for the investment and
effort required. Some people do better than others at the
same venture. Perhaps your Uncle was in business during a
different era? I too remember when everyone paid list price.
A shop could make a good living in those days.

Whatever, I'm glad he did well.

7052. TEN TEC 705 mic QUESTION

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-09 03:12:01 UTC
From: qrp5@my-deja.com
Message-ID: <cce22972.0112081912.1cb29f1c@posting.google.com>
Source record: 50856

My Ten Tec 705 desk mic has a pecularity that I'd like to inquire about. (A couple of my friends have the same trouble with their 705's) When I turn on my transceiver, the mic goes into LOCK mode. The mic transmits all noise / conversation until it is noticed that the LOCK light is illuminated. If I turn the radio off, then back on, the problem does not occur. If the radio is left off for a period of time, the mic goes immediately into LOCK mode when the radio is turned on.
The problem I experience is associated with the use of a Corsair radio, as well as a Scout. Others I've talked to have the problem with similar radios. Have you had this problem with your 705 mic? What's the fix? (mine just came back from the factory repair department and it still has the problem) Comments? Johnny

nice rig, built in the 70's, thought to be one of the best for its time and type. It requires a good understanding of tuning the resonant circuits and adjusting the load.
They usually can be had for 4-500 bucks.
for an additional 2-300 bucks, the TS-50S can be had which is good stuff too, solid state, and easy to use.

Just regitering a website with a search engine isn't always the only best
way to get the word out about a website, which he didn't actually post his.
Besides, it's not like he's mass-posting. I would hardly call a single post,
nothing fancy, no MLM and nothing outright lieing (like most spam would).
Also, just because you say it's "spam" doesn't mean it's "spam". I mean,
just because you don't want certain information doesn't mean the rest of us
don't. You're quite cynical, IMHO.

7060. Kenwood G707 mic problem

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-09 06:21:55 UTC
From: "Joe Bramblett, KD5NRH" <kd5nrh@kd5nrh.net>
Message-ID: <8924DCF63D796CC0.AF2FA958EF9B1B98.2AD986DB3462DAAD@lp.airnews.net>
Source record: 50864

It seems my YL managed to get Coke all over my 707's mic. I've cleaned it out, but it still doesn't quite work; if I switch the 'Lock' on, all the non-locked stuff (DTMF pad and PTT) works ok, but if I switch the lock off, it mutes the radio (including the channel change beeps and the voice stuff), none of the programmable buttons at the top works right, and the up/dwn buttons will either not work or will work *really* fast. Also, with the lock off, any of the programmable buttons or the up/dwn buttons will sometimes (randomly, about 1 in 6 presses) turn the radio off.

Anybody have a schematic for this mic, or any ideas what might fix it?

Reminds me of that old Saturday Night Live skit back in the 70's, "The
Pepsi Syndrome". Had a similar thing happen to me with a soft drink,
fortunately not quite as bad, from the sound of things. What did you
use to clean it? In my case, isopropanol was my solvent of choice,;
flushed some into the buttons and exercised them then flushed them
again and then repeated the process about 4 or 5 times before it
became usable again. This was on the older version Kenwood mic
without the backlit buttons though and they might have been better
sealed against liquid intrusion. The real key for me was the flushing
versus just soaking it in the isoprpanol (which I initially did with
no success). If you have access to a lab supply shop, they sell
plastic squeeze bottles with a narrow tip that make it easy to flush
in tight places without using large amounts of fluid.

Good luck & 73,
Howard KE6MAK

>use to clean it? In my case, isopropanol was my solvent of choice,;

91% isopropanol. Tough to find, sometimes, but Albertson's
occasionally keeps it in stock. 91% dries quicker than the regular
70% stuff.

>flushed some into the buttons and exercised them then flushed them
>again and then repeated the process about 4 or 5 times before it
>became usable again. This was on the older version Kenwood mic
>without the backlit buttons though and they might have been better
>sealed against liquid intrusion.

I doubt it; this one's pretty well made, with plastic shields behind
every opening except the PTT, but it was apparently right in the path
of the spill, so it got soaked well beyond what it was intended to
handle..

> The real key for me was the flushing
>versus just soaking it in the isoprpanol (which I initially did with
>no success). If you have access to a lab supply shop, they sell
>plastic squeeze bottles with a narrow tip that make it easy to flush

I might have to try that, but I'm fairly certain that something got
fried, since I've rinsed, swabbed, and soaked it twice now.

Hi all. I'm looking for a B&W model 551A coaxial in-out switch.

Please email to the address below stating condition and price, shipped
to NH. Or you can call the numbers below.

THANKS!

7065. NA-144XL circuit diagram?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-09 14:28:06 UTC
From: Duncan Clark <NEWS@[127.0.0.1]>
Message-ID: <AMoWzVA2T3E8Ew5d@ntlworld.com>
Source record: 50869

Hi Folks,

I have a 6m modified (not by me) NAG144XL, single 4CX350, which I bought a year or so ago. I have a manual but no circuit diagram, especially for the control boards. It started playing up on the change over relays yesterday. One is staying on tx when it shouldn't and it is not mechanically sticking. I can clear it each over by knocking off the operate switch, just makes changeover's slow! It's a nightmare to try and track down the fault as the amp is anything but spacious to work in. If anyone has a circuit diagram and can scan it and e-mail it to me on my reply-to address, in any graphics format, I would be very grateful.

If you hear me on 6m this afternoon, bear with me!

Tahnks in anticipation

This is an RF Power Meter for 30-600 MHz and includes a 150 watt air-cooled dummy load. Made by Electro Impulse Laboratory, Inc., it has 50 and 150 watt meter ranges, a large 3 1/2" meter, and measures 7.5 x 5.5 x 16.5 inches. Weight is 9 lbs. The front panel snaps off the rest of the unit and can be separated from the rest of the unit. Has female "N" connector. Unit is very clean - one side has the remnants of a sticky label. Works fine and readings compare well with my Bird 43. Price is $95 and you pay shipping. Here are some photographs:

7073. FS: MFJ-945C Versa Tuner II

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-09 15:49:44 UTC
From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <sKLQ7.14636$714.1512864@newsread1.prod.itd.earthlink.net>
Source record: 50878

This is a nice compact tuner for home or mobile operation. Handles 300W on 160 through 10 meters and will tune a coaxial line, single wire, or balanced feedline. A single meter reads forward power or SWR. I have the manual for the later model, the 945E. $72 and you pay shipping. Here are some photos of the tuner:
http://home.sprintmail.com/~sentek/pc080021.jpg
http://home.sprintmail.com/~sentek/pc080023.jpg
http://home.sprintmail.com/~sentek/pc080025.jpg
http://home.sprintmail.com/~sentek/pc080028.jpg

If you're just getting started on HF, this tuner will handle just about any type of antenna you might want to use.

It's not mass-posting?... Lessee... How many thousands of us do you think bothered to open his post looking for more info related to the thread we've been following?
Maybe you're confusing "mass posting" with "cross posting"?... The way I see it, this's MUCH worse than spamming thru email.. There, it's somewhat simple to detect spam by looking at the subject: line and delete it before reading.. When you append it to a current thread in a ng, otoh, the readers get quite a ways into it before realizing the trap they've gotten themselves into.. There's no way to unread the time you've then wasted on it...

> Just regitering a website with a search engine isn't always the only best

Source record: 50884

Actually, what you describe *is* "scientific", or strictly according to "theoretical antenna engineering". You apparently just don't understand the science and engineering.

The starting point for this thread had to do with a 50-Ohm load on a 50-Ohm line. In that case, the line is "flat", and changing its length will not change the impedance seen at the opposite end. In your example, the antenna apparently is not a 50-Ohm load. So the line is not flat, and changing the length will indeed change the impedance seen at the opposite end.

It's all there in the theory that you sneer at. Get a good book, and look up the transmission line equations.

7089. Re: ICOM 746 LOW POWER?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-09 21:39:49 UTC
From: Gary - KJ6Q <davison7@gte.net>
Message-ID: <FSQQ7.759$qS6.211184@dfiatx1-snr1.gtei.net>
Source record: 50893

I don't "sneer" at engineering-theory - what I *DO* question is REAL LIFE APPLICATION of what we
hams ACTUALLY deal with on a regular basis! In the common employment of standard antennas - especially pronounced on 2 meters and higher (what THIS thread is discussing...), virtually EVERY
antenna system *I* have built or bought has displayed EXACTLY the same characteristic of displaying
varying SWR depending on precise coaxial feedline length.

NOW, a ham relying strictly upon "engineering theory", would merely shrug his shoulders if his new 2
meter system loaded poorly due to high SWR, and ASSUME that NOTHING other than extensive redesign of
the antenna ITSELF (cursing that devious, incompetent manufacturer the whole time!) could correct
his "problem", when actually all he might need do is experiment with different feedline lengths in
order to obtain a properly functioning system... I mean, what POSSIBLE use could it DO to change
feedline length, when that "engineering Bible" sez it will DO NO GOOD, or have ANY effect in
altering resonance/impedence at the transmitter end? And how many commonly available beams DO
present a perfectly stable 50 ohm load at the desired operating frequency straight from the factory?

Blind acceptance of engineering fact/theory as an unyielding ABSOLUTE, without the ingenuity and
willingness to EXPERIMENT with usable and workable alternatives that seemingly are diametrically
OPPOSED to "known fact", place an artificial limitation that is totally foolish, arbitrary and
unnecessary.

You stick with your books, and *I* will continue to thrash on ignorantly with what has worked quite
well for ME in amateur radio for over 40 years...

Carl my friend, this is the direct result of R. Hollingsworth's
cracking down on the infamous 14.313 vs 14.300 "Booer
War" of 1978-1996. It lasted that long (18 years!!) and dragged in
just about every single nut case on ham radio, like as if you
dumped ten gallons of honey into a bathtub in woods full of black bears.
Unfortunatly when Reily cleaned up this incredible mess, the people who *lived for* this
RF mayhem suddenly had no outlet for their frustrations. Enter the
internet and Newsgroups! The rest is, shall we say, history?

Someone could write 2 books on it. Believe me. One version would
provide material for Comedy Central Networks or The Jerry Springer
Show, while the other would make an excellent paper for study by
the American College of Psychiatric Medicine.

The key word is 'system' - feedline and antenna.
You can do the same thing with a length of coax with no antenna attached.

A chunk of co-ax, open at the far end will behave as a short circuit at a quarter wavelength, and a high impedance (I avoided the temptation to write infinite) at a half wave. Somewhere between 1/4 and 1/2 wave you can find just about any impedance you like - of course the energy fed into the system is dissipated in heating the co-ax but the transmitter is happy.

Just did it to prove the point. Attached a half wave of open coax to the transmitter and started to cut pieces off - soon found a point where the transmitter happily provided maximum rated output - kept on cutting and the power started to fall.

The transmitter was quite happy to feed full power into an open feedline which, in complete accordance with theory, displayed an impedance of 50 ohms at the transmitter connector. BUT, only at that precise frequency.

With a real non-inductive 50 ohm load at the other end of the feedline I would not expect any length of line, within reason, to have any effect at the transmitter end.

Seems to me if you want the power to go to the antenna and not be wasted in heating the feedline you should adjust the antenna instead of the line.

Dave

I have for sale a Kenwood TS-870 S. The rig is in excellent condition, I have the original shipping boxes and hand mic. I have the manual some where around, but I haven't found it as of yet. but I will go to the Kenwood website download and print the manual if worst comes to worst.

Price $1100 plus shipping

If you would like to include the Kenwood PS-52 Power supply which is also in excellent condition.

add $150 plus shipping. I will not sell the power supply until rig is sold.

Kenwood VS-2 Voice unit $65 shipped

Kenwood DRU-3A Digital Recording Unit $75 shipped

Kenwood SP-31 Speaker 2 @ $75 each plus shipping

Sell as a package for $1500 shipped.

If interested, please e-mail me direct.

K4FFA@home.com

Thanks,

Phillip Johnson KB4I

If the postal service breaks it, I'll ask them to pay you for the loss. I'm not rich and can't afford to get back a broken radio and also insure you myself.

> Nice disclaimer, made me just want to hurry and buy it.

Fair enough. This deal is not for you.

> Seeing UPS denies a
> majority of claims, and you make no promise of any functionality.

Say, that's not quite true, is it? The first two words in my description are "mint-condition." I thought that would communicate 100% functionality. The radio is in perfect working order. (btw, I said "USPS," not "UPS.")

> Not saying you're doing anything dishonest, but your auction leaves a lot
> of worry for us experienced folk.

I'm worried, too. This is my first auction. I borrowed that line from someone who sold me a working device with no problem. I asked why he used it and learned that people sometimes ship working items, then get told they don't work after a few days, and are expected to just send the money back in return for a now-dead device that was working perfectly when shipped. In other words, they end up lending something at no cost to someone who then breaks it, and uses that to unwind the deal. If you open a box at the post office and show them the damage, you have a pretty good chance of getting reimbursed. If you know a better way for me to deal with the risk of the rare but dangerous dishonest buyer, please tell me what it is. I'll sincerely consider it. Meanwhile, the compromise I'm offering is that I'll pack it up and insure it for you, and let your right to post negative feedback about me protect your interests. Again, if I'm not doing this the best way you know, please advise me.

7101. What crystal frequencies do I use ???

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-10 01:20:09 UTC
From: Alvaro Blanco <obdulia@telcel.net.ve>
Message-ID: <O2UQ7.1050$F3.434@news01.t-net.net.ve>
Source record: 50806

Hello everybody out there. I recently buy an old VHF repeater. Both the receiver and transmitter cards have crystals that make the gear to receive on 160 MHz and transmit on 164 MHz. I check the frequency of both crystal and it is around 50 MHz which confused me a little bit as I was expecting crystal frequencies to match the transmit and receive frequencies. I like to put this rig to work on the amateur 2 m band range but I am not sure about the frequency of the crystals that I need to do this job, based on the information I previously mentioned.

Could one of you, please, help me in understanding and making a choice of the right frequency for the crystals I'm looking for ? Frequencies I like to work on 2m is 147.00 Mhz for receiving and +600 Hz offset.... Thanks a lot in advance for your advices.....

It might help if you told what brand and modle the repeater is.

Every differant brand and maybe modle can be differant. You need to get some background in radio if you expected the crystals to match the TX/RX frequencies. The transmitter crystal is usually some submultiple of the transmitter frequency. Such as devide the frequency by 8 or 12 or 18 or 24. The rX crystal is usually something like the receive frequcncy minus the IF frequency then devide that nymber by 3. This is just one example, there can be other ways it is done.

> you know, please advise me.
>

I'd say, if it were me (and I'm no auction virgin), I let the winner decide
on insurance (I've not sold many items over 100bucks), anyone wishing to
have their item insured will then understand what insurance is about. I
also mention in all my sales that items will not be doa, other than that,
no warranty. To me, it means, the day I see confirmation of delivery I'd
better see an email telling me it's dead, or they're out of luck
themselves. Yes, it does say Mint condition, but then the doa remark gets
ya wondering.
It's a fine looking radio by the way, and if I wasnt full up on 2 meter
gear, i'd buy it myself.

Hmmm... If it doesn't sell, I'll relist it with that variation.

> I also mention in all my sales that items will not be doa,

But how do you guarantee that? I could guarantee that it will not _ship_
dead, but no one can guarantee how it will arrive.

> other than that,
> no warranty. To me, it means, the day I see confirmation of delivery I'd
> better see an email telling me it's dead, or they're out of luck
> themselves.

Well, that's kind of what I had in mind. That is, I'll help anyone who
promptly notifies me that it was broken in shipment to get reimbursed, while
everyone else is on their own, which I think is fair. I just can't afford,
literally, to take responsibility for it personally.

> Yes, it does say Mint condition, but then the doa remark gets
> ya wondering.

To be frank with you, that's kind of okay with me. What I mean is that I
know some people will get nervous if they are asked to accept any part of
the risk that is inherent in these transactions, but I've had a couple of
rough 'net commerce experiences, and I'd rather let the skittish buyers do
business with someone else. (Maybe you know the kind of experience I mean,
where you get asked, after you think you've closed the deal, to start
agreeing to all kinds of warranties, partial payments, return periods, extra
charges, etc.) Sure, a crook could sell a dead item, and let the buyer deal
with the problems of who proving who damaged it, while keeping the money.
However, that trick won't work very many times. After all, if the same
shipper starts filing lots of damaged-in-transit insurance claims, the
postal service will begin to look at him or her very closely. So, unless a
crook is ready to commit both mail and insurance fraud for no more than a

few hundred dollars before rising to an almost certain risk of being caught, the likelihood of anyone being screwed on an eBay deal this way is pretty small. That's why I bought a $575 item with the exact same language in the ad. I knew who the seller was before I bought, where I could find him, and that both eBay and the postal service had verified his identity beforehand.

> It's a fine looking radio by the way, and if I wasnt full up on 2 meter
> gear, i'd buy it myself.

Yes, it's a very decent HT. I bought a Yaesu VX-5R and can't justify owning the Icom at the same time. Haven't used it much, except for scanning and a couple of road trips, which is why it is still mint. I must have left it on the charger too long or something, because the nicad pack stopped holding a charge a couple of years ago. That's why I got the BP-90 and, somewhere along the line, mislaid the nicad (no loss, since it's dead now anyway). I actually came to prefer the BP-90, since I used the beast so rarely that it was nice to know a handful of AA cells could put me on the air, reliably and instantly, whenever I needed them to.

If you know a new tech or anyone else who can use it, please point them at the ad.

Crusty,
WA4LDA

In order to order a crystal, in additon to the frequency you will also have to know if it is series or parallel resonant and if parallel, what the load capacitance is.

Crystal companies used to have that info for a variety of commercial transceivers by make and model.

Yes, I do. That's what I meant. I just noticed how long my "ignore" list for these newsgroups had become. I'm ignoring more people in these three newsgroups than in all the other newsgroups I read combined. I was amazed at the signal to noise ratio around here.

With nearly all of the HF rigs coming with six meters today,
six meters is nowhere as lonely as it used to be.

Small antennas with unexpected band openings, good local
propagation and even repeaters give the band a "flavor" of
its own. It's not HF with all of the power freaks and it's
not two meters with the handi-talkie only crowd either. I've
always preferred six meters over the other bands. Then
again, no one has ever called me "normal" either...<G>

Well, you see, I've been on the net a looooong time, much longer than most people have known it was around. I saw the earliest spam, and it looked nothing like this guys posting. As a matter of fact, no spam I've ever seen has ever looked like this and on topic. I think you're confusing actual spam with someone actually offering to help out the situation some instead of complaining about it. Hhhhmm..... Sound like spam? I don't think so....

Maybe , but I usually prefer not to use such schemes unless I design
them that way in the first place. IE: using measured stubs, or
transformers of a different value coax.
>
> The effect of demonstrated - or apparent - resonance and feedpoint impedance is easily
demonstrated

along with
> it - of the system in use.

It shouldn't though if everything is hunky dory. IE: the antenna
matches the feedline, and you don't have common mode currents flowing
on the shield.
If both of these are ok, it won't matter what the length is.

I did it as recently as last night on 2 meters, when installing a
new
> SWR bridge in line to the VHF output of my Icom 746 - the SWR went CONSIDERABLY higher as
indicated
> on both the bridge and the indicator on the 746 with the change I initially used in the
> installation - yet NOTHING in the antenna itself was in any way changed.

Sure, you may a slight mismatch to the line, and you also may have
some common mode currents flowing on the shield.

Trial and error with
> different short lengths of interconnecting coax, as it has ALWAYS done thru the years,
soon restored

> LENGTH - and can as EASILY make the SAME antenna APPEAR resonant at 50 ohms at 146.500 - just as it
> did when I first connected the new SWR bridge that changed the feedline length!

I have no real gripe with you doing this, but it's not the method I would take.
I would tune the antenna to the feedline, and make sure no common mode currents reared their ugly heads. After that , it wouldn't matter what length line I used. In all my coax fed antennas I have , not a single one has ever been tuned by varying the feedline length. I have coax fed dipoles and verticals on hf, and two yagi's , one for 6 and one for 2 meters. None require me to tweak the feedline lengths. If I want to move the resonance to another frequency, I have to get on the roof and adjust the gamma match, say in the case of one of my yagi's. And in that case, I couldn't move too far, unless I wanted to tweak element lengths to keep the same gain/fb numbers.

>
>
> NOW, that ain't "scientific", or strictly according to "theoretical antenna engineering" - but IT IS

> manipulated and altered by the simple juggling of coax length that SHOULDN'T (in theory) have ANY
> effect upon either resonant frequency OR impedance of the system!

But in the scenario you describe, according to theory ,it does make perfect sense. You have an apparant mismatch between your antenna and the feedline. You also may have a small amount of common mode currents flowing on the shield. In either or both of these cases, what you are doing will work. It's just not my preferred route to go.
>
> You may quote theoretical electronics to me all you wish - but *I know* what WORKS in actual
> practice, regardless of technical bafflegab that might be used to explain it away or render it
> irrelevent!

Well, I don't think I've said anything that is overly technical. In fact, I usually shy away from overly technical jabber. I *know* that what you are doing is working for you. I'm just saying if I had to do it, it would be done a different way. MK

7115. Question about Heathkit HFT-9A

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-10 06:28:56 UTC
From: vhfradiobuff@aol.comspamsux
Message-ID: <20011210012856.14590.00000900@mb-fb.aol.com>
Source record: 50819

Hello. I was wondering if anyone could answer a question about the Heathkit HFT-9A HF antenna tuner. The documentation for it says it works up to 100 watts. I think most tuners have 2 max ratings - one for FM/AM and one for SSB/CW. Usually the one for SSB/CW is significantly higher than FM/AM. Can anyone tell me if the HFT-9A can take more than 100 watts on SSB?

No, I would correct the real problem. Either the antenna was not correctly measured, or the matching device needed to be adjusted.

I mean, what POSSIBLE use could it DO to change
> feedline length, when that "engineering Bible" sez it will DO NO GOOD, or have ANY effect in
> altering resonance/impedence at the transmitter end? And how many commonly available beams DO
> present a perfectly stable 50 ohm load at the desired operating frequency straight from the factory?

Many. I know my was A4S right on the money the first time I built it. I built a 3 el 6m yagi about 2 months ago, and again , no problems at all. I had a decent match the first time I fired it up, and I was using a gamma match. If I did have a mismatch, I would adjust the gamma match, not the coax length.
>
> Blind acceptance of engineering fact/theory as an unyielding ABSOLUTE, without the ingenuity and

diametrically
> OPPOSED to "known fact", place an artificial limitation that is totally foolish, arbitrary and
> unnecessary.

No, it's just that I've already tried what you do, mainly by accident,
and found out I like other methods better. If varying coax length
varies the SWR, something is not quite right with the antenna to
feedline connection/match or the antenna is poorly decoupled.
>
> You stick with your books, and *I* will continue to thrash on ignorantly with what has worked quite
> well for ME in amateur radio for over 40 years...

No problems with me...It's your antenna. MK

RADIO HABANA CUBA
DXERS UNLIMITED

WEEKEND EDITION
SATURDAY, DECEMBER 8, 2001

By Arnie Coro CO2KK

Send your comments, questions and ideas to: arnie@radiohc.org

Hi amigos, welcome to the weekend edition of your favorite radio hobby program, our special for radioaficionados around the world! I am Arnie Coro, radio amateur CO2KK now ready to share with you today about seventeen of air time....

AND here is Item one: Another meteor shower just around the corner....remember that the very late evening and early morning hours of your local time are the best to benefit from meteor scatter propagation... Radio meteors should provide an excellent opportunity for TV and FM band Dxers to add many more stations to their logs, while amateur radio operators on the 10, 6, and 2 meter bands will enjoy yet another opportunity to work this unsual mode....

Item two: Solar activity still high enough that the ionosphere is still supporting very high daytime maximum useable frequencies, so expect more 6 meter band F2 openings during the next two to three days... So far this fall season has proven to be the best for 50 megahertz ionospheric propagation of the whole cycle 23.

Item three: Many e-mail messages received here dealing with homebrew radios, a topic that has brought a lot of attention from both regular and new Dxers Unlimited's listeners... Today, I'll continue telling you more about homebrew radio designs, and why your home built radio designed for experimenting, may outperform even very expensive commercially built receivers....

And as always at the end of the show, our HF plus 6 meters propagation update and forecast will be reaching you to help plan your operating schedule amigos!!! Margarita Delgado is my sound engineer and producer, I'll be back with you all in a few seconds...

This is the weekend edition of Dxers Unlimited reaching you during a very special weekend HF propagation, as a matter of fact, conditions are as good as any long-time short wave listener can remember amigos!!! TV DX enthusiasts should keep their VCR's rolling to pick up those very rare,

but possible, F2 layer refracted signals that are only seen during the peak of the solar cycle... YES, if you have the appropriate type of receiver, capable of receiving different TV broadcast transmission standards, it is possible to pick up TV DX that reaches your set not via the typical sporadic E mode, but via the much longer range F2 single or multiple hop modes. Imagine watching Australian low band TV in the Caribbean, or picking up a New Zealand TV station in Buenos Aires, well all this is possible when the F2 MUF goes above 45 megaHertz and higher!!!

Don't forget to keep a log of your TV DX and make at least one copy of those unique VCR tapes whenever you happen to be lucky enough to pick up one of those elusive F2 TV DX openings. And, please do share your experiences with the worldwide audience of Dxers Unlimited by sending your comments about the F2 TV DX openings e-mail to arnie@radiohc.org or via FAX to the following number 53-7-705810....

Now here is item three of today's edition of Dxers Unlimited... more about homebrew radios: Well, amigos, it's nice to see that this topic has generated such a great interest and also to realize how creative our listeners are.... I want to say again that I have received several very interesting e-mail messages about the power supply and the front end of the SUPER REGENERODYNE homebrew radio, and some of them are really funny... like the listener who said, "Arnie why attempt to build a NEW receiver using vacuum tubes for the front end?" so I decided to answer both, directly to him via e-mail and now on the air...

Amigo, if you happen to live in a part of the world where thunderstorms are frequent, as we do here in the Caribbean, then you will know why many radio amateurs have lost not one, but two or three or more times their front end amplifier devices... MOSFET's are particularly delicate electronic components, no matter how you try to provide protection for them... And there are two radio frequency amplifier circuits that perform at least as well as the best MOSFET in the frequency range from the Low Frequency bands all the way up to the 50 megaHertz, amigos. One is the standard classic pentode RF amplifier stage, and the other one, that I like best, is the cascode, using dual triodes or a pair of individual triodes.

Well, again, I want to tell you that there was another e-mail that came in from a Dxers Unlimited's fan that told me that he had already built a better supply than the one I described, because his supply uses a fully electronically variable and regulated high voltage power unit, using a technology that was very popular during the nineteen-fifties at the microwave radio relay systems sites... To all of you interested in homebrewing your own radio gear I just want to say something... there is nothing like operating a radio set that you have built yourself, no matter if it is a single transistor crystal set plus audio amplifier, or a sophisticated dual or triple conversion receiver!!!

Now, let's move ahead with today's description of the DREAM RADIO's detector stages, that are capable of receiving AM, CW,SSB and Narrow Band FM signals... After testing many different regenerative detector circuits,

I decided to settle with the very easy to design, assemble and operate Hartley type classic triode detector, which uses a cathode tap to the grid coil in order to provide the required feedback to make the detector operate. My other choice is the use of a small tetrode or pentode vacuum tube that provides the advantage of easily controlling the gain of the detector stage by changing the tube's screen voltage...

The DREAM radio has the possibility of choosing from up to four different detectors, a standard AM envelope detector using a vacuum tube diode, a detector using a triode connected as an infinite impedance configuration, a regenerative detector and, last but not least, a classic discriminator type FM detector...

Yes, I agree that this adds one more switch control to play with, but please realize that this is an experimental receiver, a radio that provides a lot of enjoyment to the operator by playing around with the careful adjustment of its operating parameters!!!

The Hartley regenerative detector has an amazing sensitivity and stability, and it operates even with extremely low plate and screen voltages. By the way, both plate and screen voltages are regulated, adding to the stability of the circuit, that can be taken very, very near to the point of oscillation, where the Q of the tuned circuit is extremely high, and kept there to provide razor-sharp selectivity when receiving CW Morse Code Signals. As regulated voltage is available, the infinite impedance triode detector is also fed from the regulator, but of course the diode detectors do not require plate voltage to operate!!!

More about the DREAM RADIO's different detectors after this short musical interval... Amigos you are listening to the weekend edition of Dxers Unlimited, you can send your signal reports an comments via e-mail to arnie@radiohc.org and Via AIR MAIL, a postcard will be fine, to Arnie Coro, RADIO HAVANA CUBA, HAVANA, CUBA.

Now, more about the detector stages used in my DREAM RADIO EXPERIMENTAL MODULAR RECEIVER!!! The detector stages are all fully enclosed in a shielded compartment, with the plug in coils properly spaced away from the walls of the compartment so that the Q or factor of merit of the coils won't be degraded by the proximity of the metal shield... The coils were designed for the highest possible Q, and I have wound them in both very high quality ceramic coil forms and easy to work with PVC drain pipe coil forms, without really noticing any difference in operation between the two types of coil forms, at least in the range from 500 kiloHertz all the way up to 10 megaHertz...

Anyway, as you have heard or read, the SUPER REGENERODYNE'S detector stage normally operates in the range from 2 to 4 megaHertz or near to this frequency range... The idea of covering just 2 megaHertz per band is to provide a very good calibration that holds for each of the bands, as the crystal-controlled front end simply mixes the incoming signals from the antenna down to the 2 to 4 megaHertz range... In other words, your regenerative detector is always tuned from 2 to 4 megaHertz.... In my

DREAM RADIO, I do not use a crystal-controlled front end all the time; that is, I can change from the crystal-controlled oscillator to a variable frequency oscillator, something that must be done so that FM reception is possible... In other words, the FM discriminator type detector operates at a fixed frequency of 4.5 megaHertz that was chosen because of the easy availability of 4.5 megaHertz TV sound intermediate frequency amplifier transformers, so you do need to do the tuning by changing the frequency of the front end's local oscillator.

As I have said here at Dxers Unlimited many times, regenerative receivers are ideal for homebrewing and their tolerance for parts values is outstanding.., but combining conventional super-heterodyne technology with a regenerative detector stage is a really nice approach to homebrewing a sensitive and low-cost radio. But the DREAM RADIO was not thought as a low-cost project, as anyone attempting to build his or her own version of the DREAM RADIO will be willing to spend quite some time and shopping around for the specialized components required for the project.

Next Tuesday and Wednesday UTC days, during our regular mid-week edition of this show, I will continue describing my DREAM RADIO -- another hybrid receiver that uses both solid state and vacuum tube components to achieve outstanding performance while keeping things rather simple and easy to assemble, even for old timers who have a hard time working with miniature electronic devices!!! Because in these designs absolutely no attempt was made to miniaturize the receiver and modular construction was used, so that a lot of experimenting can be done without spoiling already fully operational, well-tried and proven modules...those that you want to keep intact after all the experiments.

Well amigos, I hope you are enjoying this step-by-step description of my latest radio receiver project, one that has drawn from the experience of many enthusiastic radio experimenters around the world who have made the wonderful gesture of sharing with all of us the results of hundreds of hours of hard work.... And as a local radio amateur here in Havana told me a few days ago, one can start building a simple power supply and a regenerative receiver for the 80 and 40 meter bands, that is also capable of tuning the very popular 6 megaHertz international short wave broadcast band, using recycled components to keep the cost of the project pretty low... Also, these radios are ideal for showing at the radio club's meetings and keeping one right next to your store-bought, professionally built receiver will not only help you realize the amazing sensitivity that they have and their razor-sharp selectivity when properly adjusted, but also will provide that additional radio that is so nice to have when chasing for DX without losing the broadcast time of your favorite radio hobby program!!! Without forgetting the fact that the basic receiver will work nicely as the TAIL END of a nice front end converter!!!

And now amigos, as always at the end of the show here is Arnie Coro's Dxers Unlimited's HF plus 6 meters propagation update and forecast... Solar activity will probably go below the 200 solar flux units mark very shortly, but the ionosphere is in such a healthy state that very high

daytime maximum useable frequencies are going to continue happening during the next several days....

Ten meters was open Friday from shortly before sunrise here in Havana to hours after sunset. Now scientists are talking about a second peak of cycle 23, something will equate this cycle with cycle 21 for its level of activity... Expect very nice propagation conditions on an almost round the clock basis this week, and don't forget to at least monitor an empty FM broadcast band channel during the upcoming Meteor Shower. You can leave the tape recorder rolling and then come back from your visual observations of the shooting stars... The same holds for an empty VHF low band TV channel if you are fortunate to have one in your locality, just leave the VCR running.

Attention 6 meter band operators, this is a special advisory for YOU!!! Chances of worldwide 6 meter openings are very good both on Sunday December 9th and Monday December 10th, so be on the alert looking for those nice DX stations that are populating 6 meters nowadays!!!

And don't forget to send me your signal reports, radio hobby related questions and comments about the show to arnie@radiohc.org or VIA AIR MAIL, a postcard will be OK, to Arnie Coro, Radio Havana Cuba Havana, Cuba.

7119. FL2100 B Modifications...

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-10 12:04:10 UTC
From: Jochen Cichon <joschi@vizzavi.net>
Message-ID: <9v28ea$326$1@newsread4.arcor-online.net>
Source record: 50824

I've heard about a modification to bring the WARC abnds to the FL2100B

Is that true? If yes where can i get the mod?
If not, where can I get a baseball rack to hit somebodies head :))

Tnx...
jochen dh1jc

See Carl?? That persons response ("You don't have the ability to ignore
topics and/or persons on your own?") is very typical around here. I guess
we are not as smart as the rest of them...or as considerate. Some people
have the need have to rip or put someone down to make them feel better.

7121. WTB: Old Motorola MC1466, MC1466L, MC1566, MC1566L ICs (chips)

I am looking to buy old discontinued Motorola MC1466, MC1466L, MC1566, MC1566L ICs. These are regulator chips. In or out of circuit, as long as they're good.

Check your ham shack, your junk box, old power supplies, etc. I'll buy one or more from you.

Thanks!

What about those who choose (or for that matter can't get) not to have a credit card? There are over a million people in this category that Internet commerce is not getting any sales for.
If someone could come up with a plastic version of a travelers check, with a number like on a credit card that would be accepted like a credit card, that would be a cool solution. You could purchase these from a credible lending institution. Once the card has been used up, it is either dead, or rechargeable at a legitimate bank. Kinda like a gift certificate you can spend anywhere a credit card is good at. Any ideres?

Hi,
good point kc8pmx, in the markets here in town the conistar machines that count and give you your own money back after a small counting fee % now offer a mastercard for coin or currency deposited inside the magic bill validator. No statements, no interest etc they are aiming these to people who do not want a credit card or cant get one or want a way to spend on the www or just to keep the wife/hubby in the dark on their purchases or the motel 6 !

They have them. Open up a checking account at a bank you like, that has ATM cards. As long as their ATM card has a "visa" or " mastercard" logo somwhere on it, it can be used anywhere that Visa/MC are accepted. You don't even have to tell the cashier that it's a "debit Card", & it is only good up to the amount in the account. No Aplications, no credit checks, no paypal, no monthly bills.

All true, but we had a bad experience with one of these being used to debit our account by about $850 at a fancy hotel we'd never visited. As soon as we noticed the charge, we contacted the bank, which promptly said we would not be liable for the bill until and unless it was shown to be valid. But, they did _not_ credit the amount back to our account until that process was completed. With a credit card, at least you aren't actually out the money while you wait for resolution.

Also, you develop no credit history with the ATM card, nor can you accumulate points to redeem for stuff from the card company's catalog (we've been to Hawaii, twice, on points accumulated via reimbursed expenses).

I am director of marketing for an autoparts wholesaler where we have two T-1's and about 30 phone sales people. We have about 6 counter people. It is a continual battle for us to weigh calls against walk-in trade; however, there are huge benefits to having sales people deal face-to-face with walk-in traffic, least of which is that of having a training ground.

Not only do I train newbies on our counter, but I also require each phone salesperson to get up off of his butt a few hours each week to meet customers face-to-face It is far too easy for phone sales people to forget who they are dealing with. Far too often I hear, "What's your account number?" Or, "okay", instead of 'Thank you for the order'. We've all been there, and we know when we have a grumpy phone sales person on the other end of the phone. By having a counter area at least the sales people are reminded of who they are dealing with. The experience carries over to the phone bank.

I won't even get into the times the counter saved us because UPS went on strike, or the times the customers saved us shipping expenses. (I've often thought about discounting freight costs to the customers if they picked up their order)

Here's a point I haven't seen discussed yet in this thread. Everyone has
been speaking about walk-ins and phone customers as if they were two
distinct and separate groups of people. Guess what? - some days I'm a
walk-in and some days I order via Internet or telephone. When I'm treated
poorly as a walk-in, I move all my business elsewhere and make sure all my
friends know why.

I don't use a credit card with pay pay, I let them debit/credit my checking account. By banking laws, you have 90 days to revoke authorization on any electronic funds transfer to/from your account, pay-pal's bank is required to return the funds!

So if pay-pal takes money I don't want them to, or fails to send money I request after taking it, I can simply call my bank, revoke authorization, and then pay-pal is pretty much out of luck, unless they want to go to court and sue. In which case they'll have to prove their case :)

So I think they are ok for small transactions, I'd never accept pay-pal payment for any transaction much over $100-200, too costly.

Source record: 50841

Absolutely Right, Floyd!

The "walk in customer is a PITA" approach is very very short sighted.
If you try to categorize salesperson/sales/time between walk ins and
phone customers, you can get led in some way off directions. Its beyond quantifying.

I happened to be in Florida a year or so ago when I stopped in AES to
buy my HT. the salesperson was polite, took more than 10 minutes with
me, and sold me a nice HT. This is bad and they are losing money
correct? Now I do all my phone business with them, soley on account of
the kindness I was shown on that first visit. Now how does that figure in?

The whole thing needs to be approached as a cost of doing business, not
as a formula. I sold automotive parts years ago. For the first month, I
looked like the crappiest salesperson in the world. I would spend as
much time with the customers as needed, and most of them just gave me
petty little orders. Then after a few more months, the orders started
pouring in. The customers appreciated the ability to follow through on
the small orders, and switched their business to me. They were giving me
a test if you like. But it worked.

I don't sell any more, but I learned one really important lesson. Treat
the potential customer nicely, and you will be rewarded. I just treated
these guys like I wanted to be treated. They liked it, and rewarded me
with their business.

7138. RFI: Setting Wide/Narrow Mode on VX-150?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-10 17:38:51 UTC
From: Lord Slime <jbyrnesNO@SPAMfriiPLEASE.com>
Message-ID: <Pp6R7.1039$Fbh.304717824@news.frii.net>
Source record: 50842

I just did the Mars/Cap modification on a VX-150. Everything went smoothly except that now the transmit volume is very low. Among other things, someone suggested that the "Wide/Narrow" mode somehow was set to narrow when the radio was reset (automatically after the mod).

I've found the W/N circuitry on the schematic, but need to be able to locate it on the PCB. But my main hope is that this is a programmable feature. If you have the service manual, would you help me out?

Thanks,

John

7139. Re: ICOM 746 LOW POWER?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-10 18:29:59 UTC
From: Gary - KJ6Q <davison7@gte.net>
Message-ID: <Ha7R7.136$vo1.47703@dfiatx1-snr1.gtei.net>
Source record: 50843

DAVE sez:

"With a real non-inductive 50 ohm load at the other end of the feedline I
would not expect any length of line, within reason, to have any effect
at the transmitter end"

Which HAS BEEN *precisely* MY point!

In actual, real life practice, there are PRECIOUS FEW "real, non-inductive 50 ohm load(s))
in actaul
use by hams - especially as we get into VHF/UHF frequencies!

SO, to grandly quote textbook "rules" as absolutes in such cases is both unrealistic and
foolish!

The sinple act of installing coax connectors has the unavoidable effect of creating minute
alterations in feedline impedence - and by the time you include a SWR bridge, a coax
switch, and
another 4 to 6 coax fittings to interconnect all this stuff together, what losses and
impedence are
you NOW operating under?

THIS is the REAL WORLD many (most?) of us are actually operating in, and in such cases,
smuggly
quoting meaningless textbook responses is just THAT, MEANINGLESS!

I don't challenge for a MOMENT the textbook, theoritical "truth" as it applies to feedlines
- I
merely want to stress that very FEW of us are using the pure, unblemished installations
that those
textbooks are designed to address... And to arbitrarily IGNORE that fact, and deny the
readily
available work-arounds to restore our access to a reasonably properly operating system due
to
artifical constraints imposed by blind faith in "textbook truth", is self defeating.

Nope, they did make ham gear. My dad, Wï¿½MYT bought one of these new back about 1966 or 67 (don't remember the exact year). Was a nice mobile rig. The problem with these things now is that many of the transistors used were proprietary and no direct replacements are available any more. If one of those transistors goes out, your'e screwed.

7142. Mods for FT-817 ?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-10 19:18:14 UTC
From: Torbj&#65533;rn Morka <tmorka@online.no>

Source record: 50846

I can see that in the schematic for this JAPANESE version 1Jxxxx there are
tree Jumper-places, JP4004-6 "SRX", "STX" and "EXP".
I have only tryed to solder off JP005, the "EXP" is factory un-solded.
This is due to description in http://www.mods.dk

But i still cant manage to get it to transmit out of band...
Not that i want it for more than CB-1-40 that is... And to receive from
above 154 Mhz would also be nice... (137-174, and not -154)

Thanks.

Which sorta brings us to the crux of the issue - assuming we both have a reasonably properly
designed identical antenna installations, and the simple act of installation has introduced
variables that has now created a VSWR of, say, 1 1/2 to 1 that we both find unacceptable, YOU would
spend several hours, or more, lowering your tower to effect a change of match at the ANTENNA
itself - while *I* spend several MINUTES doing the SAME THING (in practical effect and end result)
at the transmitter end with a simple swap in feedline length... AND in such a case, can you REALLY
and HONESTLY tell me that *anyone* on the distant end of our subsequent QSOs will in the SLIGHTEST
detect ANY difference in our relative signals?

I don't argue that YOUR way is incorrect - only that it is needlessly labor intensive, and the
difference in end result will likely be the same in BOTH cases - only YOURS came from a textbook,
and mine came from actual. practical experience. YES, *I* have done it BOTH ways, and found the end

results to be identical - so why beat myself up doing it the "textbook" way?

I certainly agree as to the basic importance of a good understanding as to the principles and
theories of antenna/feedline matching - just as it is to recognize the available work-arounds that
MAY provide a practical and effective alternative solution, essentially delivering the same result
with less effort - after all, we don'r ALL relish the notion of labor intensive antenna adjustments
in wind, rain or snow - especially when an added foot or two of feedline in the warmth of our
hamshack might be just as effective and lots faster!

And keep in mind I have been referring here to relatively MINOR mismatches - not radical or major
design or material flaws that I claim can or should then be corrected simply by feedline
manipulation! I maintain that up to a certain point, the SIMPLE and less "technically correct" way
will deliver essentially the SAME level of effectiveness and efficiency as the more "textbook
correct" method. Sloppy? Perhaps, in the eyes of a purist, but pretty effective and practical in
real life!

Bad idea. With a checking account, the money is gone right away, and you have to fight to get it back. At least with a credit card, you can challenge the charge and not be out any money unless/and until you are proved wrong.

>
> So if pay-pal takes money I don't want them to, or fails to send money I

So let's say that PayPal take $1000.00 from your checking account, and you don't agree to it. Well, the money is gone nonetheless, and it may well cause you to bounce other checks all over town as a result.

You contact your bank to challenge the debit, and they then contact PayPal. PayPal tells them (like they told me once) "Sorry, we have no record of that transaction". Your money is still gone, your other checks have still bounced, and your bank says "Sorry, Sir, I guess you will have to sue PayPal to get your money back".

So, while you are answering phone calls from your other creditors who are calling about their bounced checks, and looking for a lawyer to sue PayPal, the lawyer tells you that he needs a retainer to start proceedings. One small problem, you can't write him a check because you don't know if there is any money left in your checking account, or if another fraudulent debit may hit at any time. And to top it all off, the lawyer tells you that it will typically be 2 to 5 years before your case comes to trial.

And you still think linking the PayPal "service" to your checking account is worth the risk ?

This is a case of comparing apples to oranges, Alan.

How many auto parts customers expect you to remove a carb from the box, hook it up to an engine and run it, just to see how it works? It's pretty common for a prospective customer of a ham radio to expect a ham dealer to hook up a rig to an antenna and let them play for a while. Is the rig still "new" after such a session? Remember, not every ham retailer is large enough to have several demo radios hooked up for customer try-outs.

Ed,

They are not all that different. Go to any retail auto parts store on any given day and you will overhear, "but, it makes this funny clicking noise...", or, "it only shuts off only when the engine heats up or once I get going down the highway...".

I like the carburetor analogy, ever try to sell one of THOSE things to a customer who refuses to give you the tag number? Phew!

I don't deny lines have to be drawn. For instance, I don't allow my salespeople to leave the building, otherwise some of them would be out in the parking lot this minute trying to diagnose engine problems. I do, however, expect my sales people to be attentive, courteous, and kind. They don't have to climb under the hood, likewise, I wouldn't expect a clerk at a Ham Radio store to tell me why I can't load up my amplifier. In your example, I wouldn't expect a clerk to hook up a new radio either. It would be a bonus if the retailer had a facsimile set up.

All a good sales person has to do is show a little respect 90% of the time. It sounded like the original poster of this thread wasn't even shown that.

Alan

It isn't really fair to compare a store that is part of a chain, to one that is a single, independent entity. The chain store has more profit with which to buffer the time wasters' (PITA) effect upon their business.

It should also be considered that walk-ins were not considered a PITA until after years of experience revealed them to be so. It wasn't the other way around.

Knowing the true mechanics of operating a business can be compared to knowing
the details of what goes into scrapple. Not everyone can handle this knowledge without modifying their behavior afterwards.

Phew! It's amazing how fast the postings fly when you leave computer for a bit! Enough has gone back and forth that I won't beat the technical issues anymore. Actually it seems that the various postings don't differ all that much over the technical realities.

But you know, Gary, it does appear that you're sneering at the theory. I think the problem faced by the ham who merely shrugs his shoulders if his new 2 meter system loaded poorly would not be that he relied strictly on engineering theory, but that he relied too little. Also, I think the flaws you attribute to the literature ("engineering bible") aren't there. My books have lots on the variation of impedance along a line and the effects of stubs and other matching tools. And I know of at least one ham (Cecil Moore) who has been quite outspoken about these methods; his web site has (had?) a special section on "my feedline tunes my antenna".

Do most hams know enough about this? I don't think so. Remember, the starting point for this thread was that a few hams thought you could change the impedance at the end of a flat line by changing its length. Do most hams know enough about digital data transmission or microwave equipment? I don't think so. And we probably never will. But the solution to the issues you bring up is to continue learning more theory, not less. Because the theory is not in error. It's *very* good.

... Rich

Contact International Crystal Manufacturing in Sheridan, OK and tell them
the name and model number of the repeater you have, then the frequencies
you want to put it on. That's pretty much all they need along with your
Credit Card Number and six weeks to make them.

I've bought some crystals from Bomar as of late and they also seem to be
very good and better priced for those of us willing to recrystal a channel
element.

cheers

Special valves for sale:

The following valves are for sale. They are unused unless otherwise specified, and mostly in original boxes. They are all in stock and can be shipped immediately to anywhere in the world.

2 pcs 3069M Large, round CRT in super heavy duty packing material each in a wooden barrel. One in

completely ew, obviously never unpacked (only

by me for inspection), the other one seems also to be new and unused but it has been opened by someone. Price: US$ 150.- each

8 pcs F16-10LD CRT by GEC (some boxes says 'Haltron' on the outside. I have not opened to verify). They are obviously all unused.
Price: US$ 100.- each

1 pcs F16-10LD CRT as above, but made by Mullard.

Price: US$ 100.-

1 pcs F16-10LD CRT as above, but this one is used. It has a little spot on the screen. Price: US$ 50.-

4 pcs 7BP7 CRT. The boxes says 'Haltron' I have not looked inside. Unused and unopened.
Price: US$ 100.- each

5 pcs 5FP7 CRT. The boxes says 'Haltron'. Some are opened and some are sealed. All the valves are

obviously unused Price: US$ 50.- each

6 pcs P535/1E STC pulse modulator valve. Also coded CV 427. It is similar to 715C. All unused.
Price: US$ 50.- each

1 pcs P535/1E Same as above, but this one seems to be used.
Price: US$ 30.-

6 pcs C1148 EEV pulse modulator valve. Unused and in original boxes Price: US$ 50.- each

12 pcs C1150/1 EEV pulse modulator valve. Unused and in original boxes Price: US$ 50.- each

3 pcs C1166 EEV pulse modulator valve. Unused and in original
boxes. Price: US$ 50.- each

1 pcs QF 451 Ferranti. Looks like a radar TR switch and unused.
Price: US$ 20.-

1 pcs KS 9-40D Mullard klystron. Unused in sealed box Price: US$ 20.-

4 pcs M509 EEV magnetron. Also coded CV 3982. Unused in
sealed box Price: US$ 50.- each

2 pcs M599 EEV magnetron. Unused in sealed box
Price: US$ 50.- each

1 pcs JP 9-75 Mullard magnetron. Unused in sealed box
Price: US$ 50.-

7 pcs 24B1 STC trigatron valve. Unused in original box (Strange
looking valvel) Price: US$ 30.- each

11 pcs 725A Western Electric magnetron. Unused in sealed boxes.
Price: US$ 30.- each

E-mail me if interested. Offers are also welcome.

Best regards,

Perhaps not fair, but I can be sure to give my money to the people who treat me right. But I am willing to concede that if the salesperson thinks I'm wasting their time, then I will waste no more of their time. Ever.

Interesting question. If the carburetor cost $3,000 (like a transceiver), and there were three brands to choose from, and there were definite and known operational differences, and it could be hooked up in five minutes, I suspect that just about everyone would want to try it out before buying. Continuing the auto related analogy, how many folks would shell out even $3,000 for a used car without being able to try it out? And, ever see a new car dealer who didn't have demo cars to drive? From the prices ham dealers charge for their "demo" used equipment, I doubt that they're losing money on those.

I've just added a new article to our Tech Notes page at
http://www.elecraft.com

It is titled "Transverter Application Notes" and was written by Dave Olean,
K1WHS, and Jay Rutherford, K1UC. It covers in detail the interfacing of
transverters to the K2 or just about any other HF radio.

Thanks again to Dave and Jay for writing this!

Arnie,

Fascinating stuff, especially on the homebrew "regenerodyne" receiver and the TV DX F2 possibilities. I know from watching this newsgroup (rec.radio.shortwave) you have a lot of fans who enjoy your show. As far as I know, your show is unique among major SWL broadcasters by going into a level of technical detail and into ham topics that other shows shy away from. Rest assured there's a contingent of fans here who really enjoy your show's approach.

As I've remarked in the past, a lot of us think you could put together a working radio from a cardboard box, some wet twine, a razor blade, and candle wax. :)
It's refreshing in this day of "plug and play black boxes" that some still understand that part of the fun of radio is building your own, and understanding how it all works.

Speaking of static and lightning resistance of tubes, I would imagine Cuba has quite loud thunderstorm static during the summer months. Have you done any experiments with tuned loop antennas for HF receiving, especially in the higher HF range which is traditionally not thought of as a good place to use loop antennas? It would seem such a design would provide some protection against static and could perhaps null out some local lightning noise, giving a signal-to-noise ratio advantage?

73, and thanks for posting!

hello,

i have a swan 500 station for sale. it includes the following,

Swan 500 (not c) 80-10 meters. weak on 15 meters, about 50-60 watts. 100 watts+ on 10. 120 watts on 20, 200+ on 40 and 80. radio is clean and looks good. has one scratch (small) on top of radio and slightly rubbed on the front top corners. no extra holes or apparent mods.

Swan model 117xc power supply and speaker. has been modified (no holes) with two wires from speaker where i used a dsp 9 audio filter with it.

Swan 410 vfo. matches the 500 radio. very clean. no scratches or dents. works well

Swan model 22b vfo adapter for vfo.

Swan model vx-2 vox unit.

Sure 444 desk mike with Swan logo.

Swan model fs-2 field strength meter. clean. works. has original antenna, which is rare to find these days.

this rig is excess to my needs. this radio and all equipment is in service and operational, however due to it's age i must sell it as is. i have aquired a drake tr4c and have a couple of heath rigs so i must sell this to finance an amplifer.

if you want to see pictures, go to http://home.earthlink.net/~ku4yp and click on radios.

asking $400.00 for all the above and will SPLIT shipping to lower 48 states. i ship from mailboxes etc. because i am willing to pay more for something packaged well. email me to discuss shipping elsewhere. i would consider a trade for a CLEAN and OPERATIONAL heathkit sb220 amplifier.

thanks for reading,

mike prevatt

Child? Child my a$$. Maybe compared to an old f@rt like you, yeah, probably.

> Why does everyone who winds up on the loosing side of any argument
> concerning the internet ALWAYS resort to this "I was on the interney WAY
> back when..." crap?...

Because, maybe those of us who HAVE been around computers a long time know a thing or two. I was programming original programs by the age of 9 and wrote my first graphical webpage when I was about 15, using notepad and Paint Shop 1.2 (I'm 27 now).

> Because you actually think anyone believes it?

No, because it's true. But you don't want to know the truths because you already seem to know it all. Well, as much as an immature 13 year old anyway.

> Sure, give us a few dates, and maybe even a school or company name in your
> next posting..

Ok, well, the first public access was Freenets, UNIX tty interface. We didn't have any around here so it was long distance. I think it was around '88 or '89 or so. Sure, BBS's were cool, but this was great because you could "talk" to all sorts of people telnet from one account to another. I only had a 2400, so transfers took a while. I had several accounts around the U.S. at several Universities, so sorry I can't remember all those schools. The first local public access didn't show up for about 3 or 4 years, and then it was using Windoze 3.1 with the Winsock dialup software. H*ll, I beta tested AOL's "Internet" services (Hahahahaha.... what a piece of crap) So, yeah, I have been around the 'net a long time. How long have you been online?

> H*ll.. I *invented* the internet... How's that?...

That's a load of B.S.. The inventer of the Internet's initials are not BD. Now who's tellin' stories?

> Spam is still SPAM...

Like I say, it depends on your preceptions and your definition of spam.

More than likely I wouldn't find that unacceptable. 1.5:1 is fine with
me usually. Doing any tricks to improve that likely wouldn't help
much, unless you needed a wider usable bandwidth.

YOU would
> spend several hours, or more, lowering your tower to effect a change of match at the
ANTENNA
> itself - while *I* spend several MINUTES doing the SAME THING (in practical effect and
end result)
> at the transmitter end with a simple swap in feedline length... AND in such a case, can
you REALLY
> and HONESTLY tell me that *anyone* on the distant end of our subsequent QSOs will in the
SLIGHTEST
> detect ANY difference in our relative signals?

I don't think you will see any improvemant by adjusting the SWR if you start out below 2:1. So in that area, we would both be wasting out time. HF in particular. Now VHF/UHF is where I start to differ. If you have an antenna on those bands that shows a large variation in SWR if you add to the feedline, I'd be worried about common mode currents more than anything. These currents will eat your lunch as far as performance on those bands as they will skew the pattern up off the horizon. So if the antenna in question showed this problem, and you "fixed" it by adding line to get a better match, and I fixed mine by adding better decoupling, my antenna would win. Hands down I bet.

> I don't argue that YOUR way is incorrect - only that it is needlessly labor intensive, and the
> difference in end result will likely be the same in BOTH cases - only YOURS came from a textbook,
> and mine came from actual. practical experience.

No, mine is from experience too. What makes you think I never do this in the real world?

YES, *I* have done it BOTH ways, and found the end
> results to be identical - so why beat myself up doing it the "textbook" way?

Mainly common mode problems if that were the case.

> I certainly agree as to the basic importance of a good understanding as to the principles and

> hamshack might be just as effective and lots faster!

Oh, in general I'm fairly lazy really. I don't like to take my mast down unless I have to. I had to do it yesterday, and it's still down. Why did I take it down? I'm getting AM-BC spurs on 160m, and I'm trying to find the source. Believe me, I had better things to do. But the AM spurs are driving me crazy.
I thought I had a metal to metal "diode effect" in the area, but I never did pin it down yesterday. My antennas are still down low as I want to check more tomorrow.

> And keep in mind I have been referring here to relatively MINOR mismatches - not radical or major
> design or material flaws that I claim can or should then be corrected simply by feedline
> manipulation! I maintain that up to a certain point, the SIMPLE and less "technically correct" way
> will deliver essentially the SAME level of effectiveness and efficiency as the more

"textbook
> correct" method. Sloppy? Perhaps, in the eyes of a purist, but pretty effective and practical in
> real life!

Many times yes, mainly on HF, but on VHF/UHF, I disagree. Common mode currents are the usual suspect there. Or should be the first thing looked into anyway.
And I'm well aware of Cecils setup, but he is using ladder line, not coax. His setup was designed that way. MK

7169. IC-706g BPF problems???

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-11 08:46:04 UTC
From: nm5k@wt.net
Message-ID: <25eb70d7.0112110046.54f40724@posting.google.com>
Source record: 50773

Hi all, I'm curious. I've been noting a problem here that mainly effects the 706g. I've been noticing a lot more AM-BC spur crud in the 160m and longwave areas on that rig. When I first got the rig, I didn't notice these problems except maybe at the low end of the longwave band. Now, I've been thinking I had a local problem that was causing this such as a metal to metal bad connection that is acting as a diode and causing spurs. But so far I can't nail down the source. I had thought it might be in my mast or guy wires, but after checking all that I can't find the problem. It has seemed that this noise has slowly crept in over time, but recently got a good bit worse. Thats why I thought a local "diode" problem. But I notice that my 830 is much less prone to picking this up, although it still gets a bit. Whats getting me, is when I first got the 706, I didn't notice this hardly at all on 160m. I'm starting to wonder if maybe the band pass filter section might be acting up, and not blocking the AM energy as well as it should.
The goofy part is a couple of my other antennas don't seem to do this. IE: I can hook up a ladder line fed 30m dipole, and run it as a T vertical straight to the rig with no tuner, and I don't get this AM racket. I can use my attic LL fed 40m dipole, and I get very little. Only my big 160,80,40 parallel dipoles on a metal mast is showing this to a large degree. Now if I use a tuner as a preselector of sorts, the AM noise goes away. So that leads me to believe the AM noise is coming thru the antenna, and can be filtered out. I guess the question is has anyone had problems with the BP filters going kaput on a 706? Or maybe I'm just getting stronger AM signals than I did a few months ago, maybe due to more moisture in the soil, etc and the radio is having trouble keeping them out??? It's quite strange being as it didn't do this a few months ago. I'll keep poking around outside to try to find a problem.The antenna is exactly the same as before when I didn't notice this noise. Nothing has changed that I can notice, and I have tried different coax, with no luck. But if I can't I'll have to assume it's possible the radio has a filter/relay problem possibly. If thats the case, I want to get it fixed before the warranty runs out. :/ But, I still haven't confirmed the real problem yet. Anyone out there have BPF/relay problems on a ic-706 ? MK

Mark:

I've got the same radio, although the extent of my HF antennas at present is a G5RV in the inverted V configuration with the peak about 50 feet up in a tree. I've noticed no such problems here.

How long have you had the 706? Are you within a few miles of a AM broadcast station? Is it possible that the connections to your parallel dipoles from the balun/coax have corroded? Is it possible that your balun/choke (if you're using one) has some water in it?

How are the dipole ends isolated from their respective supports? Are they "wet"? Does rearranging the dipoles affect the condition? Do you have suspended power lines in the area (within 100 or so yards) of your antennas? Do you hear anything new and different on VHF or UHF? Is your tower grounded or ungrounded?

I know, it's a gazillion questions you've probably already asked yourself, but they bear looking into.

Source record: 50780

I used to run 6 many years ago, and in a fringe
area where the tv sets were running so wide open
to get anything that even six meter skip would clobber
sets on all the lower channels!
I also ran 6 in Chicago and Cedar Rapids Iowa for
a short time, and tvi was unavoidable. Even 5 watts
at the very bottom of the band would completely
clobber tv sets on all the bottom end channels!

Cable tv is the only thing that saves 6 meters,
provided that use of ham bands as tv channels is banned.

Getting calls that you are clobbering a channel that actually
uses the band that you are using is ridiculous!
I have gotten 2 meter tvi complaints as a result of leaky
cables and have had to call the cable company to fix leaks
to stop those complaints.

About 10 months or so.
Are you within a few miles of a AM
> broadcast station?

Well, a few miles, but this hasn't been a problem until recently.

Is it possible that the connections to your parallel
> dipoles from the balun/coax have corroded? Is it possible that your
> balun/choke (if you're using one) has some water in it?

Don't think so. I've had it down about 4 times checking it. I redid
the connections not too long ago. I looked at it yesterday and all
seems normal. I'm using a coax choke, and it does it choke or no
choke.
>
> How are the dipole ends isolated from their respective supports? Are
> they "wet"? Does rearranging the dipoles affect the condition?

Insulators, no, and no.

Do you
> have suspended power lines in the area (within 100 or so yards) of your
> antennas?

Yes, but it has never been a problem before. Of course, there could be
a new "bad" metal connection somewhere.
Do you hear anything new and different on VHF or UHF?

No. The radio is normal in all respects, except for the increased BC
spurs on 160 and longwave.
Is your
> tower grounded or ungrounded?

Mast, and it's grounded, but yesterday I also pulled it up off the
ground as a test, made no difference. Also makes no difference if I
ground the mast or not.
I'm really hoping it's a external rectification problem, or just
normal overloading of the rig within it's normal specs of filtering.

But it's strange that it used to be pretty quiet so I know it's not normal. I only have a couple of months warranty left, so if I do have a problem, I need to make sure of it, and send it in. On the other hand, if the rig is living up to it's normal specs and the problem is just an increased AM-BC level here locally, I'd hate to send it in and have them tell me it's perfectly normal. Being it doesn't do it on other antennas , I'm guessing the rig is normal, but then again the AM-BC level would likely be lower anyway due to the smaller antenna. But I'm guessing that if I did have a BPF problem, it would do it on all antennas no matter what size. On the other hand, the tuner kills it dead, and that would point to a lousy BPF operation in that region possibly. "AM-BC". It does it much less to my 830 than the 706. In the past after I first got it , I didn't notice that great a difference between the two. If the suppression in the past was borderline, and I had an increase due to level or spurs, that could push me over the edge as far as suppressing it just in the rig. In that case, the rig would be normal. Not as good as the 830 as far as chopping the crud, but normal.
I'll feel like an idiot if I end up sending in a normal rig, so I gotta make sure...:(MK

Enter the menu (F then 0-set key) select menu #33
which shows NAR / WID press (F) then turn VFO
knob to select WID for wide band width, then press
the PTT to save the setting.

Source record: 50699

I have one and it is a good radio. I only had one problem, it is very "picky" about the DC voltage. Or at least mine is. Before I ran the wiring harness directly to the battery, it would lose it's memory if I tried to key up without the engine running. Really surprised me as a Kenwood 261 had ran in the exact same set-up for a couple of years without a problem. After I ran the power leads directly to the battery, no problem.

It's nice having a DCS decode, as some of the public service agencies I like to keep an ear on use DCS instead of the old standard PL tones. Being able to program the DCS allows me to monitor the ones I like to hear without having to listen to some agencies on the same frequency I'm not interested in.

Body handling: HTML body converted to readable text

You are wrong about this. Checks are one thing they are a "contract" because you signed it. Electronic fund transfers don't have a signature and are governed by federal regulations. You can right now go to your bank and revoke authorization for all electronic debits to your checking account as far back as 90 days (auto insurance payment, mortgage payment, etc. that were taken electronically from your checking account). Your bank has to refund you the money. This law exists specifically so a vendor (paypal), or bank can not debit funds from your checking account without your permission.

It does not matter if Pay-Pal has any record of the transaction, your bank does, all the details are right in your banks computer. If pay-pal debited your checking account without your permission, and your bank did not inform you that you had the right to revoke that debit, then they did you a diservice.

And you don't have to "fight" with your bank, simply tell them the debit was not authorized by you and that they need to revoke it immediately. Overdraft fees are another issue... generally banks will waive all overdraft fees if an unauthorized transaction occurs, additionally, they will provide a letter to any body you wrote checks to explaining the situation, but that sometimes depends on the bank.

Actually pay-pal is quite at risk here, you can revoke "valid" debits by pay-pal to your checking account, the bank will take the money back from pay-pals account. Then pay-pal can only get the money by suing you. They can not go to your bank and say ... "Wait a minute.. he really wanted us to take the money, you have to give it back to us!". The bank won't do it!

You are just as securely protected from unauthorized electronic withdrawls from your checking account as you are with your credit card.

Well, IMHO, If it does it to the 830 as well, then perhaps it's an external problem, and the 706 is more sensitive to it... Is there someone else nearby who owns a 706 that you could borrow for a few hours to test your theory? My thought being that if the second 706 shows the same problem, then it's probably external or at the antenna.

It IS possible that the power company's lines corroded on their insulators, or some of their connections, but I would think that the problem would appear over several bands if that were the case.

It's certainly a pickle. I hope you get it figured out.

Source record: 50703

Hello OM's.

Being so new to the hobby, and not really knowing what's out there, I've got some new needs and some questions.

I'd like to purchase a small linear amplifier for my station. I'm currently running an ICOM IC-706MkIIG on the base, and some nights on 40 meters 100 watts isn't enough. I'm also not a rich man (if I was, I'd be running a 2800H for 2/440 and a 756PRO II for HF & 6).

What I'm looking for is a couple hundred more watts... Between 300 and 500 or so. Something that could be powered by 120V house current or that wouldn't drain the car battery I'm currently using to power the 706 (with a small power supply to keep it charged, of course). I could possibly add another battery in parallel to keep the voltage and current up if need be.

What's out there that would meet these needs, and wouldn't break the bank of a guy who works as an assistant manager at a pizza joint?

Your constructive thoughts, comments, and advice are welcome.

I've not noticed that to an unusual level with my G model - tho' I *do* have definite BC spurs on
160 and 80 meters that show up on the 706, TS-570, IC-746, and my Drake B line. The spurs disappear
almost completely when I activate the attenuator - which I normally engage on those bands anyway. I
too have assumed rectification somewhere in my system, and have done lots of checking, but no
success in locating or eliminating the cause.

Maybe I need to adjust the length of my feedline? :-)

I noticed yesterday that I'm having a problem with the main tuning dial on my FT736R. When I turn the dial, the frequency 'bounces' around, and does not move in a linear fashion either up or down. I 'think' that if I push the dial in while turning, it does not appear to be as erratic. The channel control works fine when the FM and SSB step controls are on. Is this a common problem with this rig? Is there any easy fix? Is the tuning control an optical encoding device? Thank you for any assistance.

I tried using the attenuator and it helps some, but it's still not as good as using one of the other antennas with no attenuator. I did a bit more checking today and I got out a freq counter and checked all my lines. Guess what...That feedline hovered about the 1000 kc area and fluctuated. So it does appear that line/antenna is awful hot with AM-BC energy. All the others were fairly dead to AM-BC. I'm back to thinking the radio is ok, and I have a problem with the antenna etc. I wish I had a battery radio that I could tune to the spur frequency and walk around, but I don't. I might rig up the counter and prowl around outside with it. It can run on batteries. I used to not have this problem at all, then it started a few months ago, only if I had the shield of the coax drop grounded at the base of the mast. Now it does it grounded or not. Maybe the counter will help nail it down. MK

My FT-757GXII does something like this when the
power supply voltage goes down to about 11.7 volts.
You might want to check the power supply...

Well, I do wish you luck. Let us know how it turns out... And while it's raining, listen to see if the problem gets worse.. If it's a power line or antenna problem, the extra conductivity from the water on the insulators/connections might "improve" the signal of the emissions you don't want (if it's the power lines) or reduce it (if it's your antenna connections)... Worth a shot anyway.

Again, please let us know what it was. I'm sure the information will help more people with it being out here.

Mark:

Another thought... If you have the extra feedline to do it, try taking a foot or so off of it, and see what happens. The shield on your coax may be resonant with something that's broadcasting in the area, which might cause current along the shield of the feedline, which might explain your problem... Again, it's worth a shot.

Please visit my website for details on the mobile amplifier I use.
Go to the Mobile Information Link.
It has a link to where it can be purchased.
http://www.qsl.net/wd5bjq
Look for link to Worthmore Amplifier

I own two of these units, and they are priced very competitively
to other amplifiers on the market. You can easily run the smaller
one on a 35 amp power supply.

7215. advice needed on heathkit dx-60 crystals

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-12 00:38:47 UTC
From: paper342@yahoo.com
Message-ID: <rGxR7.15$YE4.3887@newshog.newsread.com>
Source record: 50719

Hi,

I am in the process of purchasing a heathkit dx-60 for my fiancee's son. It's his xmas present. Anyway, he's got his novice license, and the plan is for him to be able to xmit cw on the 40 meter band. Currently he has a mfj 1040 rig, but he's studying for his tech plus and possibly even his general license.

I know a bit about Ham and radio, but haven't gotten a license yet myself. Anyway, I'll need to get some crystals for this rig. I talked to a few people... one person said he thinks the sockets might be hc-17/u sockets. Is that correct?

I think I read once that transmitters don't necessarily transmit on the frequency on the crystal. Instead they often use a multiplier or something on the crystal. Can someone clear this up for me? What frequencies are pretty popular in the 40 meter band and how do I do the math to calculate the actual frequency being transmitted on based on the crystal, or is the frequency of the crystal I stick in the socket going to be the frequency I am xmitting on?

Also, can someone verify for me what kind of crystals I need for the sockets in the Heathkit dx-60? I'm aware that we could track down a vfo somewhere, but the crystal idea just seems neat for some reason, sorta a making do with minimal equipment.

Please cc responses to paper342@yahoo.com so I don't miss any

Thanks

I'm pretty sure the DX-60 uses FT243 type crystals, and it functions on the fundamental frequency
for 80 and 40 meters, and multiples on 20 meters and above - this a 7.010 mhz crystal for 40 meters
will also function on the second multiple, or 14.020 mhz, etc...

Okay I see.... So if someone wanted to give me or I wanted to give someone say 100 bucks to spend as they see fit or spend as I see fit as the cases may be, I need to go to the bank, file an application for a checking account, go through the credit crap they NOW require on checking accounts etc, (the only way to get a debit card) just to use a service like paypal or to purchase from a Internet business. Kinda alot of hassle if you ask me. Again, back to the root of my question/statements, is there yet, by any major financial institution, a financial transaction device much like a money order or travelers check or even a general "good-almost-anywhere" gift certificate?

Again, I beleive that the Internet marketing movement needs to deal with this issue to make the internet worthwile.

The Ameritron AL-811 is about as inexpensive a tube amp as you'll find new,
running about $600 w/110-volt power supply. It's hard to get much below that and
maintain quality.

If that's too much, there's always tons of used amps on ebay -- Heath 220s and
the like that you can pick up cheaper.

Thanks Bob.

The worry I have about ebay is that one doesn't always get what he paid
for. I've looked at a few SB-200's and SB-220's on ebay, and was
tempted. An SB-200 sounds like it might do the job, too, but I know next
to nothing about what tubes for one would cost, if they went bad in
shipping or something, what tubes they run, how many, etc, etc, etc.

Thus the purpose of this thread.

I do appreciate the input.

7227. Getting back into Ham Radio - a few questions on a mobile rig

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-12 05:15:11 UTC
From: David Hawkins <dthawk@NOSPAM.hotmail.com>
Message-ID: <3c16e5e5_2@newsa.ev1.net>

Hi all,

Looking to get back into my old Hobby I've been absent from to long.
Got licensed back in 1977 at age 14 and now a few years older it seems.
Last active in Ham Radio while a Radioman serving with Coast Guard in 1985
on the Icebreaker Northwind out of Wilmington NC.

I'm wanting to get back into HF mobile radio. I like some advice on a
mobile rig.
I have used both Kenwood and Yaseu in my early days. FT-101E and TS-520S.

I've always had my eye on the Kenwood TS-50S for many years.
And the Yaseu FT-100D looks attractive with HF/VHF/UHF.
I really on want to work the HF bands.
Maybe I don't need to spend the extra cash on the FT-100D.
Tough choice. Got the cash and looking to buy soon.
Any input and opinions welcome.
I've always bought from AES in the past.
This outfit seems to be friendly and prices are right.
I live in Plano TX near Texas Towers, but these guys
are not very friendly.

Antenna questions will be next on my list but for now want more advice on a
good mobile rig.

>from .5watts to at least 1 watt

Probably possible, likely illegal, almost assuredly futile (if your looking for much extended range)... and, if it runs on 2-3 AA's, wont talk long at one watt.

If you're looking at the FT-100D, why not give the IC-706MkIIG a look. I love mine, and I've had exactly zero trouble with it since I got it back in June. HF, 6, 2, and 440 all in the same set. A tuner or a screwdriver for HF and 6, and a dualband 2/440 are all the antennas you'll need. There's even a full-blown screwdriver tuner out there which interfaces with the 706.

At least it's worth looking into.

Most small ham stores do not have any real salespeople, as
you may have noticed. A salesman is someone whose pay is
influenced by whether they make the sale or not. Such was
not the case at the ham store where I worked at part time.
Sales clerk would have been a more appropriate title.

My "other" job was a full time, commission only position.
One had to hustle to make a living doing that. I'm not sure
which pay position is better from the customer's
perspective, to be honest with you. It's easy to be friendly
when your living depends upon it. It is also easy to be less
than honest under the same circumstances. Not that I would
know, personally...<G>

Check out the Yaesu FT-817 or SGC 2020. The 817 is 5 watts and the 2020
is 20 watts. If you want like low power go to Yahoo groups and look and
the HFPack group and also the FT-817 group. The 817 is on sale for $625
somewhere. There is an article in the group about where. AES is selling
it for $659.

There are some complaints about the reliability of the ft-100 & d. The Icom correllary, the 706 models, has had far fewer complaints.

The Kenwood ts-50s also has a good reputation. It has that "kenwood audio."

The ARRL has a big web site now. If you subscribe to QST, you can go to the members-only portion of the web site, and access product reviews going back about 20 years, to check out all the rigs that have come into being since you were last in the hobby.

Source record: 50738

About two years ago I answered this same question for someone. I searched "yahoo" for "superregenerative receiver" (note that correct spelling is mandatory). Came up with several hits. One site even offered a radio kit. Several books are also available.

The ARRL Handbook has a couple of paragraphs on the subject, but I would deem it to be insufficient for getting the full theory.

7236. Re: modifying a frs 2way to 1watt

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-12 12:23:58 UTC
From: Brenda Ann <brandad@kornet.net>
Message-ID: <9v7i93$3q9$1@hiline.shinbiro.com>
Source record: 50667

The difference between 350-450mW (the average output of an FRS radio) and 1W is maybe a 20% increase in range.. or somewhere thereabouts.. rule of thumb is that for double the range, you need five times the power. This doesn't necessarily hold true with UHF HT's, since there are numerous other factors that come into play, such as line of sight propogation and the losses created by UHF signals having to pass through walls, trees, etc.

With overtime becoming abundant over the holiday season for me, I am actually going to have some extra cash to spend on something other than bills!

I am looking for either a 6 meter FM only rig or 6 meter all-mode rig, preferably a mobile configured rig, or a "base" model capable of recieving 12-13.8vDC from my auto. Please feel free to email me with what you have for sale. Appearance not as important as long as the display is readable, and the information around any dials or buttons is discernable. The radio MUST BE 100% fully operational as it was designed to be.

Thanks,
Ryan KC8PMX

The baud rate can be selected on the PRO's set mode. By default it's "auto" which means it will set itself to whatever the computer is set to. Use no parity, 8 data bits, 1 stop bit. The PRO's default address is 5C hex.

Source record: 50746

Hi David,

Nobody's mentioned the obvious choice... the Alinco DX-70TH! If
you're mainly interested in HF work, and you want something that's
dependable, easy to use, and a great performer, that's the one!
For the price, you can't beat it. I've been using a DX-70 in my
pickup for a while now, and I am thoroughly pleased with it. It
can be remote mounted, which the SGC and Kenwood can't, and it's
quite a bit less expensive and less complex than the FT-100D and
IC-706 series.

My antenna is an Outbacker Perth, which I also like very much.

Drop by my web site to see pics of my mobile station:

http://www.qsl.net/k5dh

73,
Dean, K5DH

PS: I work just down the road, at Raytheon (75 & 635)

> TT isn't "partial" to buyers... They've treated me the same (crappy), when I
> went in there to browse and when I've actuaaly bought stuff...

I've never bought anything from TT, but I was on an "antenna party" a
while back, erecting a tower for a friend. The model he bought
telescopes inside itself 3 times, which makes the top section rather
small. They recommend a Yaesu rotor for this particular tower. Well,
we had the recommended rotor and it wouldn't fit inside the
trianglular top section. (Yaesu has made a change to their rotor,
which makes it larger.) We called the tower folks and explained the
problem. They couldn't understand why we couldn't get the rotor in
there, so one of the guys at the tower company actually went outside
and climbed up on their tower and looked at the situation. (Their
older rotor fit in there fine, but the new Yaesu rotors will not.)
There wasn't much they could do to help the problem. Our friend
had already bought this tower and had spent several hundred dollars
getting it delivered. We ended up inprovising a way to use the tower
and the rotor, but it is a terrible way to have to do a new
installation. The antenna must be aligned perfectly to 274 degrees
before lowering the tower, or it will scrape the wiring off the side
of the rotor! If you're considering a new tower, make sure somebody
makes a rotor that will fit into it before it's delivered to your
door!
Always a new experience... 73, JJ

7243. Atlas 210 package for sale

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-12 14:27:36 UTC
From: Frank Krozel <frank@electronicinstrument.com>
Message-ID: <9v7idm$re0$1@slb6.atl.mindspring.net>
Source record: 50739

Hi all:
Nice and clean, working well when last used a few months ago (I have tooo much equipment).
This package is complete, Atlas 210, AC Console, Mobile bracket, mic, and of course, the manual. No scratches, dings or dents, a very nice looking radio of this vintage. Radio has the following controls: AF Gain, Normal Sideband/ Reverse Sideband, RF Gain, Dim, main dial, 80/40/20/15/10, OFF/CAL/REC/TRANS/CW, Dial Set, ALC, Mic gain, and NB variable. AC Supply is a base unit, where the Atlas slides inside it., It has speaker, mic jack on it, and a power on/off control on it.
Would make an excellent backup, portable rig (the rig is about 7 lbs or so) or just to operate and take a walk into the past....
Shipped to 48 for $300.

Source record: 50652

I operate 95 percent CW and have for the past 60 years. But on occasion I do operate SSB to chat with very old friends or my son, who is NOT a CW ham.

I bought the MFJ-616 because my hearing has lost most of the high frequency response, and phone signals are very hard for me to copy. I wear hearing aids when out in public.

I must say the MFJ-616 works great on phone. It amplifiers the frequencies I cannot hear and attenuates the ones I hear best. And, of course, it is totally controllable as far as frequency response is concerned.

But, if you are a died in the wool CW man, don't waste your hard earned bucks on it. I find the sidetone causes bad clicks on the leading edge of the characters. If you put the unit in BYPASS mode you will still get the clicks because the amplifiers stay in the circuit even though the audio reponse circuitry is cut out. It appears I have spent 170 dollars on a piece of gear that will sit on the shelf. It is NOT for the CW operator.

I just thought my CW friends would want to know....

You might take a portable Shortwave receiver (if you have one), or put the rig in the mobile
and drive along the powerline (assuming it parallels the road) and note if the BC increases at
any point. If so, you might find that the power company is the cause. Another question: prior
to your noticing the problem with the 706, both rigs were quiet, right? When the problem became noticable, BOTH rigs experienced this--just to a different degree, right? With the info I have, I would think it is external. The 706s (mine) seem to be a tad more susceptible to noise and image. I still love 'em tho. I just wish they would redesign the squelch.

Good luck!

YOu don't just hook up a scope and tune in digital modes. One way to do it for rtty is to hook the vertical input to the space tone filter and the horizontal input to the mark filter. Depending on how sharp the filters are you will see anywhere from a near horizontal line to almost a circle when the mark tone is tuned in correct. Then as the tones shift to space you will see the same thing in the vertical plane. If the tones are alternating as the station is sending data then you will have a cross patern. There are other ways to do it and get other paterns but this is the easy way to do it.

Source record: 50658

I have a WhiteLine DX-500V amp. It has serviced me WELL for over 7 yrs. with no problems.

Always reports of clean SSB audio .... No distortion when driven whith up to 30W in.

I want / need to add provisions to make it work "correctly" down to 80 meters without splurious emisions on adjacent bands or freqs.

Has anyone pulled this one off?. One would think this can be easily done.

I got rid of the "POWER" potetiometer and replaced it with 3 large ceramic resistors an a 3 position switch.

Thanks in advance for any input.

Bill (KG4IBK)

Are they "Nixie" tubes? Vacuum tube, each number has its own 'element'
in the tube, one glows while the others are dark?

7263. Re: Lithium batteries for a Radio Shack HTX-404 and HTX-202

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-13 01:52:11 UTC
From: Jim Deane <jimdeane@hot_nospam_mail.com>
Message-ID: <3C1809CB.1000106@hot_nospam_mail.com>
Source record: 50666

The only help I can be is anecdotal; I heard of a guy opening his own
radio, and installing one of the standard lithium coin-battery holders,
into which he put a new Li battery. Problem solved, no longer relying
on RS service dep't.

Would you do me a favor, email me when you figure out how best to deal
with this problem? I have a 202, it's going on 8 years old, and the
original Li is still kickin'. Or, should I say, it's tickin'?

Jim
The email is obvious, but hopefully not to spambots.

> K4KWH

I wish I had a portable . That would help mucho gumbo. I tried a few
tricks, but didn't help a lot. I hooked coax and a "stick probe" to my
counter and walked around the yard with it. It's strange...I do note a
strong AM-BC field around our house. And it's seems to be strongest
near the house. So the problem could be in here somewhere like in the
attic , or with the water pipes? or something. I then tried running
the probe to the radio itself and walked around. I never could really
pinpoint it that way as the image/spur wouldn't show up with that
small an antenna. But I did note strong AM reception, even with
nothing but a 50 ft coax with NO antenna on it. So the AM-BC fs is
strong around here, no doubt. Well , I then decided to take apart the
antenna again just to double check it. I did, and it seemed to be ok.
Still did it...So I then added and deleted antenna legs. When I
dropped the 160m legs the problem was pretty much gone. So I came to
the conclusion that there is a strong AM-BC fs, and the main problem
for the radio is it's too strong for it to totally filter on its own.
Remember, the tuner totally knocked it out. So I did an antenna
change. I took the 160m dipole legs off, and converted to an 80m
turnstile, which I had been wanted to use again anyway, and for 160m
,I now feed it as a vertical. It worked well on 160m that way, as I
had a quick QSO and got a decent report. But now at least most of it
is gone as far as the radio is concerned. Yep, the first time I ever
noticed this creeping in, was on the 830. So it's effecting both, but
the 830 is better at knocking it down on it own. I think it's

preselect, etc helps in that regard. So anyway, I guess about all I can do for now. Anyway, I came to the conclusion that I think the 706 is normal and not having a BPF problem. Yea, I know what you mean about the squelch..Too touchy to set up with weak signals. MK

I'm guessing you mean the drake 2B. I see quite a few listed here and
there. So you should be able to locate one. One thing, I don't think
drake used the "R" before the 2B on those, so that might confuse
people. I know in the manual for my 2C, it's just drake 2C. No "R".
Only the 4 line, etc used the "R". I have a set of those too...I've
got an R4 that is #0058. One of the first built in 65-66. MK

I'd have to go back and look at the tables, but I don't think that
radio supports doing that. The 706g is not as robust in the puter
control area compared to say a 756 or whatever. MK

Thanks Brent, A few days ago I spoke with LEE about purchasing a SKYWALKER 500. He graciously informed me that Mr Hollingsworth shut down (HIS and ONLY his)amplifier kit sales here in the land of the free (USA). He is however permited to sale to exporters for delivery abroad. Because I cant get the SKYWALKER, I then decided to rework my old amp. I failed to elaborate / ask LEE about purchacing parts as you sugested because the mod of my existing amp wasnt though of yet.

I will E-Mail Lee regarding this matter, Maby BIG Brother still lets him sell parts on an individual basis.

One more thing... Does this filter install internaly or externaly... my guess it would be in line after the amp but before the ant... simular to a LOW pass filter installation... Also if his filter is mearely a LOW pass in design disregarding band selection, I have several high quality 3KW ones I could use...

Another question is... Will the RF transistors (4 Pills) handle freqs as low as 3.5M?? I need to spec them out via the ID / Part numbers on them. I think they are Motorolla in origin. My guess is YES, they probibly will work.

hello,

i have a TS 50 but the maximum power is 60W on 14 Mhz and in CW (S.W.R
is good, i don't have dummy load). I've have found mods on the net and i
see
that VR 14 sets output power. I tried but no big change.

So, do you have some idea (other trimmer to adjust?).
A last question. Does someone know the function of VR1,2,3,4,5,........

Thanx in advance. 73's and good DX from France.
Merry Xmas.

Brent, in addition I gathered that you use a IC-706MKII-G from another of your postings....

I also use a 706MKII without the "G" though. This is the radio I want to run the amplifier on in conjunction with a Screwdriver ant.

From 40M on up, I can QSL with nearly every station that I hear with 100W. Just down on 80 I seem to require the extra umph.. One can expect that situation when running mobile

Thanks again

Take a look at the CI-V command set that is within the 706MKIIG owners
manual. I don't think the programming of PL tones and memory names are
part of that command set. So no software can program those items as
there is no command available for that function.

FRS radios use the GMRS frequencies.
GMRS radios can be up to (5?) watts. GMRS license is a mail in the fee type
of license.

I have monitored psk 31 on HF and I am interested in learning how to use it.
My Technician ticket does not allow HF use so I was going to "practice" in
my shack with 2ea 2 meter radios. I am working on my General ticket but the
code is going to take some time.

Happy Holidays all. I am working on a Cushman CE-4 and need to know if anyone might have a manual that can email or snailmail me a copy of one or two pages. I have found out that there is a problem with a board on the bottom of the unit. The 0710-7001 board had two transistors that went up in smoke. I cannot find my manual for this model and the CE-6 seems to have different boards.
It is the fourth board on the bottom front row, counting from the bottom

as the unit is on the bench facing you. It has three pots and a horizontal potted coil, and two IC's on it. There are a bunch of transistors located near the edge connector, toward the right side of the board. I need to know the numbers of the transistors and some of the values of the parts. Thanks Don KB6GQA

7294. DX-Central betrays it's $$$ contributors

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-13 20:38:58 UTC
From: Charles Johnston <ctj92@cableone.net>
Message-ID: <3c1911f0$1@news.bnb-lp.com>
Source record: 50598
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment

After they ask and receive who knows how much $$$ through voluntary contributions they now switch software to some one-of-a-kind never-before-heard-of "WinCluster Lite" node software.

Nearly _all_ the user-side cluster commands are no longer available such as custom login commands and filters. That's right ..no user-side filters. In fact there are only 10 user commands available. With either CLX or AR cluster software there are 2+ printed pages of user commands.

The reason as explained to me (by the software author) is that contests put such a load on the software it wasn't able to keep up. Well duh....I thought all this time I was contributing to a DX cluster and not a CONTEST cluster. There are DX spots going on every day...contests are only once-in-a-while.

Is it me or is this a case of the tail wagging the dog? Are they transforming a DX cluster service into a CONTEST cluster service without regard for DX'ers? Maybe they are contesters themselves and "to hell with the DX'ers"

Then I was told (after being one of the first to contribute $$$) that since I left the cluster I am now a 'taker' and not a 'giver'. I have informed them I want my money back..I suggest others may want to make the same demands. This will give us all a chance to see their true colors...

I was told (before contributing $$$) I would be helping to improve and support a DX cluster..not some CONTEST cluster with half-baked software....

So..if you are missing user features you have come to expect through the years then you better look elsewhere.....DX-Central ain't the same anymore.....

RADIO HABANA CUBA
DXERS UNLIMITED

MID-WEEK EDITION
TUESDAY, DECEMBER 11, 2001

By Arnie Coro CO2KK

Send your comments, questions and ideas to: arnie@radiohc.org

HI, amigos radioaficionados around the world!!! Welcome to the mid week edition of your favorite, listener oriented radio hobby program. I am Arnie Coro, radio amateur CO2KK, your friend in Havana, and host of this twice weekly show devoted to the promotion and development of our wonderful hobby... RADIO!!!

Item one: Excellent propagation conditions continue, with the solar flux still nicely above the 200 units mark, and Tuesday the A index was at the very quiet level of just 4 units!!! Propagation of DX signals in the range from 20 to 60 megaHertz via the F2 layer continues to amaze long time radio enthusiasts, that are now seeing what looks like solar cycle's 23 second peak!!!

Item two: The Geminids meteor shower is coming, and this is going to be the most active one until next year's Perseids... Learn more about the Geminid meteor shower right here on this same frequency a little later as Dxers Unlimited's mid week edition continues, and don't forget that the Canadian special SPARK transmission to celebrate Marconi's achievement in 1901 of crossing the Atlantic with a radio signal will be on the air Wednesday UTC day. This is the data about the spark transmission that is going to take place on the 80 meter band. The frequency of the spark signal's center will be 3550 kHz and the time 9pm EST or 02 hours UTC December 12...

So only those listeners who will pick up our broadcasts to Europe and the Caribbean or our first run to North America will be able to be there on time!!! Because Dxers Unlimited's first broadcast to North America is at just after 0130 UTC, so you can switch fast after listening to the show, tune 3550 kiloHertz using the AM mode, and try to pick up this special spark transmission that will celebrate Marconi's achievement 100 years ago!!!

David Wilson VE3BBN in St David's Ontario, near Niagara Falls, obtained approval from Industry Canada for a special event transmission using a

home made spark transmitter. Again the event will take place on December 12 2001, at 9 pm local eastern time, (0200 UTC), to celebrate the 100th anniversary of Marconi's historic transatlantic transmission of the letter "S" from Poldhu Cornwall to St John's, Newfoundland in 1901. The center frequency of the spark transmissions from VE3BBN will be on 3550 kHz and the time 0200 UTC Wednesday, that is again 9 pm eastern or 8 pm central Tuesday Margarita Delgado is my sound engineer and producer, and my e-mail address is very easy to remember... arnie@radiohc.org I'll be back in a few seconds...

The Geminid meteor shower will peak Thursday night/Friday morning December 13/14 offering meteor observers, and radio hobbysts a last chance to see impressive activity until next summer's Perseids. Circumstances are excellent this year for visual observations of the meteors as the new moon occurs the same day as maximum activity. The Geminids can produce more than 100 meteors per hour if seen from rural areas, and at that rate FM band and TV signals bouncing back to Earth will keep This is one of the few showers that is visible during the evening hours as the radiant rises near 1800 (6pm) local time for observers located in the mid northern latitudes. It rises earlier the further one moves north and just the opposite as one moves south.

This shower is observable from the Southern Hemisphere but at much reduced rates. On the night of maximum activity the radiant is located close to the bright star Castor, which marks the head of the western twin. Low rates may be seen as soon as it becomes totally dark. These early meteors will be earthgrazers as the travel the sky many tens of degrees lasting several seconds.

As the night progresses the meteors will become shorter but more numerous. The strongest rates will occur between 0100 and 0200 local time when the radiant lies highest in the sky. That's the time window to have all your radio and TV gear working to pick up DX via the meteor trails. The Geminids strike the earth in a perpendicular angle which produces meteors of medium velocity. Of course this depends on where you are facing and where the meteors occur. Those that occur near the radiant or near the horizon will appear slower than those appearing high in the sky and far from the radiant. The Geminids are the only major annual shower produced by an asteroid. Studies have shown that Geminid meteors are indeed more dense than other showers produced by comets, see that's why the VHF signals bounced from those meteor trails are so strong and seem to provide longer burns.....

QSL on the air, and a very special one to listener Ross Archer, who sent an e-mail that I would like to share with all of you, Ross says:

Arnie, Fascinating stuff, especially on the homebrew "regenerodyne" receiver and the TV DX F2 possibilities. I know from watching this newsgroup (rec.radio.shortwave) you have a lot of fans who enjoy your show. As far as I know, your show is unique among major SWL broadcasters by going into a level of technical detail and into ham topics that other shows shy away from. Rest assured there's a contingent of fans here who

really enjoy your show's approach.

As I've remarked in the past, a lot of us think you could put together a working radio from a cardboard box, some wet twine, a razor blade, and candle wax :)

Well amigo Ross, not exactly, but yes, recycled parts from many sources do provide enough components to build some nice gear!!! Then Ross Archer adds in his e-mail this flattering comment!!

It's refreshing in this day of "plug and play black boxes" that some still understand that part of the fun of radio is building your own, and understanding how it all works.

Ross Archer's e-mail continues by bringing in this interesting topic:

Speaking of static and lightning resistance of tubes, I would imagine Cuba has quite loud thunderstorm static during the summer months. Have you done any experiments with tuned loop antennas for HF receiving, especially in the higher HF range which is traditionally not thought of as a good place to use loop antennas? It would seem such a design would provide some protection against static and could perhaps null out some local lightning noise, giving a signal-to-noise ratio advantage?

Well amigo Ross, SURE, the magnetic loop antennas are excellent "filters" against heavy static,and you can install them at low height in order to provide a certain degree of protection against lightnning, as compared with what may happen when you are using a tall mast or tower...

And yes, amigo Ross, you are right, the directional properties of the magnetic loop, does help to null static crashes from thunderstorms, especially those that are reaching you via ground wave propagation!! Well, amigo Ross, keep listening and also reading the scripts of the show that are made available via the INTERNET and on our Dxers Unlimited website at http://www.radiohc.org/dxers/ as yet another service to the worldwide community of radio hobby enthusiasts.

One hundred years ago Italian inventor Marconi was able to pick up a signal sent across the Atlantic for the first time ever!!

In 1895 Italian inventor Guglielmo Marconi built the equipment and transmitted electrical signals through the air from one end of his house to the other, and then from the house to the garden. These experiments were, in effect, the dawn of practical wireless telegraphy or radio. Marconi was born in Bologna, Italy. His father was Italian, his mother, Irish. He was educated first in Bologna and later in Florence. Then he went to the technical school in Leghorn, where he studied physics. Following the successes of his experiments at home, Marconi became obsessed with the idea of sending messages across the Atlantic. He built a transmitter, 100 times more powerful than any previous station, at Poldhu, on the southwest tip of England, and in November 1901 installed a receiving station at St. John's, Newfoundland. On December 12, 1901, he received signals from across the ocean. News of this achievement spread

around the world, and he was acclaimed by outstanding scientists, including Thomas A. Edison. Marconi received many honors including the Nobel Prize for Physics in 1909.

And now, amigos, as always, at the end of the show, here is Arnie Coro's HF plus 6 meters propagation update and forecast:

Solar flux very near 220 and moving UP now... and a major flare was detected at 0808 December 11th, something that could have an impact later on our magnetosphere. Solar activity is expected to be from moderate to high, and the daytime maximum useable frequencies should exceed 50 megaHertz on many propagation paths.

Medium wave band Dxers should be on the alert for possible signals coming from your South, if your QTH is located at latitudes higher than about 40 degrees North.

A special advisory to 6 meter band operators... there are good chances for really long range DX on that band, and this will probably continue for the next three to five days...

Don't forget to send your signal reports, comments about the show and radio hobby related questions via e-mail to arnie@radiohc.org and VIA AIR MAIL to Arnie Coro, Radio Havana Cuba, Havana, Cuba!

Current Solar Indicies from WWV, 11-Dec-2001 at 1202 UTC
SFI = 219 A = 3 K = 1

Conditions during the last 24 hours:

Solar activity was high. The geomagnetic field was quiet. A major flare occurred at 0808 on 11 Dec.

Forecast for the next 24 hours:

Solar activity will be moderate. The geomagnetic field will be quiet to unsettled.

Solar Wind Data:

Provides solar wind velocity and energetic particle intensity. Updated at: 1421Z on December 11, 2001

Velocity (km/s): 334.0
Density (protons/cm3): 2.7

Penticton Observatory SFI Measurement:

WWV only updates its SFI reading once a day at 2100Z The Penticton solar observatory takes measurements at 1800Z, 2000Z, and 2200Z
(WWV uses the 2000Z Penticton measurement)

The Penticton Observatory SFI value on 10-Dec-2001 at 2200Z was: 223

Three Day SFI and A-index Forecast (updated daily after 2200Z): This report issued on Dec 10, 2001 at 2200Z

Date SFI A-index
10 Dec 215 8
11 Dec 215 8
12 Dec 210 8

Solar Activity Forecast:

Solar activity is expected to be mostly moderate for the next three days. There is a small chance, however, for a major flare or a proton producing flare from Region 9727, especially if magnetic flux continues to emerge.

Geophysical Activity Forecast:

The geomagnetic field is expected to be quiet to unsettled during the next three days.

Recent Major Solar Flare Activity:
(usually reported within 30 minutes of event peak)

Date Time Magnitude
08-Dec-2001 0634Z M3.4

NOAA (American) Sunspot Number:

This number is reported daily around 0225Z and reports the number of sunspots observed in the previous 24 hour period.

The NOAA Sunspot number for 10-Dec-2001 was: 224 Most recent five days (oldest first): 260 226 200 218 225

GOES-8 Background X-ray Flux:

This value is reported daily around 0225Z and reports the average background x-ray flux level as measured by the GOES-8 satellite.

The GOES-8 Background X-ray Flux level on 10-Dec-2001 was: C1

Most recent five days (oldest first): C1 C1 C1 C1 C1

No data, but the Memorizer has a TX relay in it. Check to see if its working, and maybe the contacts are dirty. Happened to me when I had mine years ago.

Let me see if I get this: you paid someone money for something that can be obtained completely free elsewhere? Or is this WinCluster something more than a regular dx-cluster freely available on the Web, through DX Monitor or dozens of telnet clusters?

7308. FT530 keypad replacement help

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-14 04:40:22 UTC
From: David L Hanson <dlhanson@dakotacom.net>
Message-ID: <3c197f7c_3@corp.newsgroups.com>
Source record: 50612

I'm trying to replace the front cover & keypad in a FT530. I've removed the six screws that appear to be all that's holding the pcb to the front cover. However, something else seems to be holding the pcb tight to the bottom of the front cover near the speaker & mic. I don't want to break the pcb trying to separate it from the front cover. Can anyone help?

Thanks.

7309. Re: DX-Central betrays it's $$$ contributors

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-14 05:22:29 UTC
From: Charles Johnston <ctj92@cableone.net>
Message-ID: <3c198cbd@news.bnb-lp.com>
Source record: 50613
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment

They asked for contributions for the upgrade of equipment at DX-Central. I gladly gave what I could with the understanding the DX Cluster would be upgraded. Apparently they had enough funds to buy new hardware (and they are still begging for $$$) but they did away with the existing full-featured software (CLX).

The explanation I got was that now (after the hardware upgrade I helped pay for) their software (CLX) was all of a sudden no good. So they removed a full featured cluster software package and substituted a software product that does not have near the number of user-side custom settings like filters,automatic login scripts, being able to block spots originating outside of USA etc...the list goes on....it is best described as some kind of beginner and / or basic cluster software...a stripped down gutted-out cluster software package....it is also a one-of-a-kind...no other DX cluster on the planet uses it. Why would they? It has basically no usable features compared to what has already been available for years!

This "upgraded" software (WinCluster Lite) is a very bare bones application that does not even begin to retain the level of performance we have all grown accustomed to over the years. They ask for contributions to improve the service and what we got was a HUGE downgrade in the software to the point it is unusable for anyone serious about DX'ing....

Bottom line.....
What I got and everyone else got for their $$$ is a crippled hardly usable dx cluster. It is a gigantic step backwards....it has in reality REMOVED many.many vital services and features.....WinCluster Lite is a joke for serious DX'ers....trying to work DX with it as a service is ridiculous....

You might give Icom an email, It has been 7 months since I left Icom.
I just looked at the command set on page 46 of the 706 MKII G manual.
I see there is the ability to enable and disable the PL tone, but I
don't remember a way of setting the actual tone frequency. There is no
way of writhing in the memory name via CI-V commands though I am sure
of that.

Hello Wes,
I choose to put technology to work for me just as Hams have always done for decades within the scope of their abilities. The "old way" is rarely the best way Wes...unless you are talking about 50 year-old hooch...

Hams are by nature innovative and are always looking for and / or creating better ways to do things.
Without using DX cluster spotting services one finds themselves at the bottom of the "DX Feeding Chain"

If that is where you want to wallow then more power to you......

This must be a question asked many times before but here we go. Where do I start? I would like to listen to North Atlantic Flights on HF, I already have a Yupiteru 7100 scanner with USB, but I cannot receive any messages on it, I also have a Palstar AA30 active antenna. With this equipment I still cannot receive any HF transmissions at all. Am I doing something wrong? What entry level equipment would I need to acheive my needs? Any advice would be most grateful.

Thanks

I am now accepting orders. Overseas shipment is confirmed. 20 3'
antenna and feeds to arrive in about 14 days. 3 taken.
I have worked very hard to bring these antennas into the country after
they were made to my design. These antenna are NOT BBQ grills posing
as microwave antenna. These are the real thing. I'm not a big
company, i'm just a Ham like you trying to fill a void out there. I
was amazed that there wasn't a single company making anything of real
quality for AO-40, so I thought I would give it a try. I hope I am not
offending anyone by posting here. I'm just trying to get the word out
and save possible customers the cost of advertising.

Drop by my new web site and look around. Leave me a comment if you
like.

Well, #1, are you listening on the right frequencies? I don't know
what that radio is capable of , so can't really comment if it's usable
or not. If it covers HF, and is USB capable, it should work as long as
the antenna is good enough. You might need to hook a longer wire
antenna of some type to it. Just a random wire strung around would
work. If you do a search on the net, you should be able to find some
frequency lists. There are many air bands through the HF spectrum, and
you will need to pick the band that would provide the best propogation
for that time of day, and paths from the radio dispatch to the planes.
A few real popular bands are 6,8,10,11 for military, 13, mhz, etc,
etc. Also many of the frequencies will have more than one radio center
on them. IE: Many of the frequencies where you might hear New York
radio, you might also hear San Juan or whatever on the same frequency.
The radio that gets the best propagation
will usually take the call. Also quite a few cities have radio
centers. We have one here in Houston. I think it's called Houston
Univeral Radio . They are on 13.330, 10.075, 6.637, for a few
examples. On other frequencies, you'll have centers for other cities.
Just tune around until you hear them or get a list. Also if you want
to decode the selcal data, you can get a selcal decoder at airnav's
website. They have a demo you can try. It works pretty well. I'd say
overall, 6,8,10,13 mhz probably the most likely to hear something. The
lower freq's in the night/evening and 13mhz in the day. as you listen
to them, you can pick up more frequencies as they transfer planes to
better working frequencies due to the conditions. You probably need a
better antenna if you can't receive them. You shouldn't have any
problem if all is working right. How do you receive other stuff such
as SW-BC and hams, etc? If you can hear hams on SSB ok, you should be

able to hear a few planes. MK

|Hello Wes,
| I choose to put technology to work for me just as Hams have always
|done for decades within the scope of their abilities. The "old way" is
|rarely the best way Wes...unless you are talking about 50 year-old
|hooch...

I don't reject new technology. I spent 33 years of my life designing, testing and supervising the construction of, state-of-the-art tactical missiles. I was using and programming an H-P computer, running HP Basic, to build automated test setups when the only DOS PC in the building was located in the engineering manager's office.

|
| Hams are by nature innovative and are always looking for and / or
|creating better ways to do things.

Yeah, I "innovated" a two-meter station that except for 50 feet of RG-17 was entirely designed and built by me. Antenna, crankup mast, rotor, transmitter, receiver, etc. With this station I made my first EME QSOs. A friend and I were the first hams in AZ and maybe much of the southwest to operate SSB on VHF, when SSB was proven to be "a better way" than AM.

| Without using DX cluster spotting services one finds themselves at the
|bottom of the "DX Feeding Chain"

Somebody has to be first to hear the DX station and generate the spot. I believe that proves my point that DX can be found and worked without using clusters. I also believe that puts one "at the top of the feeding chain." It's waiting for the spots that keeps you at the bottom.

World-wide internet spots can be of interest in seeing where the propagation is, just as the NCDXF beacons are similarly useful. Online DX newsletters and QSL info services are also useful. So I don't reject out-of-hand some of these tools. I simply contend that a cluster is not "vital" to the ability to work DX. I do not use a cluster and I still find and work DX.
|
| If that is where you want to wallow then more power to you......

Well, I'm a pretty casual DXer. If I was a "real" DXer, I wouldn't be wasting my time writing to you. Nevertheless, you claim 299 on your web site, I'm "wallowing" around at 305, not counting deleted countries, but counting 4L4FN/P5. You do have him don't you? Or did you wait until he was spotted and then found the pileup to be too big to bust with your "official" W9INN dipole

<g>.

BTW, the "biggest" HF antenna I've ever had is the homebrew (is that "innovative") 20 meter beam at 45' that I currently use. Viewable on my simple home page at:

http://users.triconet.org/wesandlinda/

Cheers,

N7WS

Hello!

I am selling a Hallicrafters R-46 speaker:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1308649152

The current price is $35, the cabinet is very very clean, and there
are pictures at the link above.

If you live in the US (lower 48) I can get it to you before Christmas.

The speaker is intended, I am told, for Hallicrafters SX-71, SX-88,
SX-100, SX-122 or other radio.

The boatanchors FAQ says you welcome commercial postings. I hope this
email has found a welcome audience.

Santa wants to know what NEW radio to get me for Christmas........

I've considered the both options below but don't know which one to pick. I have my choice between

A. The new RCI-5054 6m all mode rig
B. A 70cm mobile rig, any suggestions here?

I do not have HF privileges yet, and don't want a really fancy all band, all mode rig even though it may be easier to just get one of those. (Santa also doesn't have all that money :-).

Suggestions welcome, info is appreciated.

Thanks and Happy Holidays!

I've always considered tube testers for emission as a poor substitute
for true Gm testers, such as the B&K and Hickock testers. Emission is
okay for larger power tubes like the 6L6 and the like, but for small
signal tubes nothing beats a transconductance test.

What you might be having is a short between cathode and the suppressor
grid which are usually tied together.

Can you borrow a preselector to try on the radio? The preselector
will prove whether the problem is internal to the radio, or being
generated externally.

My 726R had the same problem, and it turned out to be the
encoder. At least in the 726R, the encoders are NOT optical--
they use small brushes as contacts over an etched digital pattern
on a pc board. If you can prove it is the encoder, and if it is
mechanical, some DeOxIT spray might correct the problem.

Not sure, but I'd double check that you didn't miss any screws that
might be hidden by copper shield or stickers, etc. I have a 470, and
seems like I ran ito that one time. It was a screw I couldn't see for
the flap of foil or whatever covering it. MK

DX clusters are the worst thing ever to happen to ham radio. Just listen (don't talk, there's enough QRM) to the nightly abomination when the P5 comes on 10 meters. What a sad state of affairs.

Isn't "the hunt" interesting? Just sitting back while your cluster software tunes you to the DX is being pretty lazy. Maybe that's why all the "wrong VFO" callers - they aren't paying attention to what they are doing because the software "does it all fo them" (albeit poorly)?

Didn't see this comment directly addressed, though much other good
input. Many of the less-complex testers will show a "short" at one
pin position due to this position being the heater or another normal
internal connection. One may have missed (or be missing) the
instruction sheet, which will typically tell this.

Hello Paul,
It seems like any mention of augmenting one's DX searches with a spotting cluster or web site immediately brings forth messages like "sitting back and letting the cluster do all your work" . Well this is not the case at least for me. I run the cluster through DXBase 2002 so that if a new one gets spotted I am notified. While that goes on in the background I am "searching and pouncing" just like the "old-timers" would like me too.

Often I am working 2 or 3 DX stations at a time. How can that be? If there are pileups and if I don't get through on the first 2 or 3 calls I write down the call and freq of the DX station and move on to another one or two doing the same with them if needed. Then it is a simple thing to check my sheet and tune the ones back in I didn't get on the first few calls. This works a treat....I just hopscotch between 3 or so stations until I get them or they fade or go qrt.....it is really quite effective...

So..there is no need to ridicule anyone for using the cluster or working DX however in the hell they please....

The real crux of my comment is you can tell as soon as some juicy DX station shows up on the cluster because things go to hell on the band. It turns into utter chaos. People start chattering away on the wrong VFO (I assume they failed to notice the station is working split). Then the "cops" chime in. And then I tune out.

I have 5 units of band pass filters. the center freq is 52.9 mhz and the filter is about 15 mhz wide.
I have network analyzer sweeps on all units. They seem to be adjustable with a adjustment on the bottom of the filter. These are small filters about 1" X 2" and have sma female connectors.

$20 each all 5 for $90..

Mike

Hello Paul,
Your comments of course are correct. But don't blame the cluster spots for human behavior patterns. I have to agree with you...often times the apparent mentality in a DX pileup is like a pack of hungry dogs salivated and fighting over the same piece of meat. But hey..if you want the DX in your log what are you going to do?

One of the DX Tips on the DX Page of my site offers a remedy for such a scenario....

To add fuel to the flames, remember that before the days of Packet Clusters there was DX clubs that had all the members phone numbers and "one ringers" were common when rare DX appeared.

Then came the DX repeaters (2M) where DX announcements were made 24 hours a day!

And since day one (maybe later) DXers subscribed to DX News Letters to get the latest DX operations - freq and time.

So don't tell me about OT's that found all there own DX, but some did.

But obtaining Honor Roll without DX Packet Clusters --- good luck Charlie!! Better quit work, get a divorce and stay up all night. But I'm sure many did.

Then there is DX Nets -- No Comment

It seems to that this could be taken a bit further. Search the band through
a computer controlled radio. When a signal is detected, the computer would
lock onto that frequency and send a signal. On receipt of a reply, it would
log the station and move on. That way you could watch TV, mow the lawn, or
whatever and just check your computer from time to time to see how its
going.

I'd rather buy a dead skunk than anything from RCI... :>)

Seriously, take a look at the Ten Tec "6n2" 6 and 2 meter dual band all mode rig. A lot of "bang for the buck" and a clean, quality product. I think they are around $700.00 new.

Personally, I would look for a good used FT-100 (my favorite) or IC-706 for around $600.00. HF,6,2,440 all mode, DSP, 100 watts, small, and when you upgrade, you'll already be set for your new band privileges. With any of these rigs, you will own a real "ham quality rig", and not a "warmed over" CB radio with little re-sale value.

Actually I would think that the clusters would prevent more "wrong VFO" type people. Most spots say "up X". More it is just poor operating. Not the cluster itself.

Kent, K9EZ

PS - I am not even trying the P5. It will be there. And it will come back after the first of the year. We will all get the chance. Though we may not be first.

Heathkit HM-102 SWR Meter with Remote Sensor - Ebay

This meter is in excellent condition. It has both 200 watt and 2000 watt power scales, as well as the SWR scale. The sensor box can be mounted into the back of the meter so that it is self-contained, or is can be mounted remotely where connections may be made more conveniently. Cosmetically, I can't find a thing wrong with it. The original manual is included.

This is a quote taken from one of the Heathkit enthusiast sites:
"The HM-102 is perhaps one of the most popular accessories Heathkit ever made. They sold zillions of them. The HM-102 is a RF power meter that will measure up to 2000 watts of RF. The HM-102 will also measure the Standing Wave Ratio between the transmitter and the antenna. The HM-102 is designed for use with 50-ohm transmission line only. The removable pickup can be placed up to six feet from the meter. No external power is required for the HM-102."

Hello Rod,
Thanks for posting your perspective on this "controversy". I know that even with my simple station my country count skyrocketed when I first connected to the N7CIX cluster (Phx,AZ) via the AA7MH repeater on our local Spruce Mt. (Prescott,AZ) It was and still is a great aid....

I would only like to add that even though one can receive the spots that does not mean one's station is up to the task. There is nothing "automatic" about getting the station in the log just because one has been notified that the DX is qrv....

"You still gotta have the Fire to the Wire" and some operating skill for good balance.....

While I've never had them do any work. What recourse do they offer if you
get a box of junk after the mod? Since the modifications are illegal and
void manufacturers warranty, do they stand behind it still?

7360. Heathkit IM-4180 Deviation Meter - Ebay

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-15 02:27:14 UTC
From: Dan Long <w4tq@mindspring.com>
Message-ID: <9vechofar1@slb6.atl.mindspring.net>
Source record: 50564

Heathkit IM-4180 Deviation Meter - Ebay

I purchased this meter at the Dayton Hamvention for $80 several years ago to set the deviation on my 2-meter packet station. It worked great for that. I connected it to my 2-meter transceiver a few days ago, and it still works fine. The previous owner made a slight modification when he removed the battery pack, and made provisions for using an AC adapter (AC adapter is supplied). Also, there are some minor scratches in the paint, but they don't detract significantly from the appearance.

For those who aren't familiar, the IM-4180 is actually a tunable radio receiver. I've used it on my 10-meter HF transceiver, as well as my 2-meter equipment. You connect your transmitter to it, using very low power, or connect an antenna to it if you're very close to the transmitting antenna. Then, you tune in a signal and select a deviation range on the meter. You modulate the transmitter and read the deviation on the meter. It also has connections for a scope and a speaker output. I never used these features, and I'm selling the unit it "as is" with regard to these features (never saw the need to use them).

I do not have the manual, but I do have an instruction sheet that someone on the "Heathkit Forum" sent to me via email.

For auction on Ebay, click on:

If you're interested in 6 meters, why not look at a rig made for hams, to begin with -- http://www.patcommradio.com/webdoc8.htm

The Patcomm dual-bander give you better performance than a warmed-over cb rig, and it will also give you a second band for hf -- something you can listen to while studying for your General ticket. I'd recommend 80, 40 or 20 as your second band, since they're pretty much open every day.

Gary,

Do you know of any plans at Icom to improve the squelch function on the 706?
Great radio, IMHO, except for the "tight" squelch. It's either on or off.
Set it too loose for weak signals and everything under the sun sets it off
(Pop! SQUAWK! POP!). Set it deep, and you lose sensitivity.

Thats what I did with the tuner, and yes, it did knock it out. I since
changed the antenna to a vertical on 160m, and I use the tuner, so in
a funky way, problem solved..:/ MK

> Gary Hildebrand WA7KKP

I know the higher $$$ testers usually are quite a bit more
reliable/accurate. I've got two of them. A hickok 539c and a sencore
MU-140. Both are pretty good and both were fairly high $$$ testers
when they were new. I use the sencore quite a bit. It's in a smaller
package than the hickock and it's fairly accurate. Of course everyone
knows about the hickoks. One thing about tube testers...They all are
getting old...So you need to watch out for bad caps, etc. MK

Jerry,

I am not aware of any plans. I left Icom in April 2001 so many things
could have changed. The squelch in the 706 is an S-Meter squelch.,
like most of Icom's HF equipment uses. If you watch the display you
will see a segment move across the display as you adjust the squelch.
This sets the requirement of the signal to be above the segment
setting before the squelch opens up.

Gary K8IZ

>Do you know of any plans at Icom to improve the squelch function on the 706?
>Great radio, IMHO, except for the "tight" squelch. It's either on or off.
>Set it too loose for weak signals and everything under the sun sets it off

7389. Carrying HT on plane

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-15 20:09:53 UTC
From: " .Jack Brody" <jackbrodynospam@netzero.net>
Message-ID: <9vgamj$f3j18$1@ID-69489.news.dfncis.de>
Source record: 50593

I would like to know whether I can take a 2m HT on plane in carry-on baggage these days. I'm not looking to use it on the plane, just to get it there without risking it in checked baggage. Maybe with battery pack separate.

And what if they do not allow it? At that point, it is probably too late to but it into the checked baggage.

Has anyone tried it lately?

Jack

Message-ID: <3C1BCE80.D6348AF7@mminternet.com>
Source record: 50498

On Oct 2, I took an HT on a flight from LAX to London. I had it in carry-on which went through x-ray with no questions asked. My guess is that the newer, smaller HT's probably closely resemble cell phones when run through the baggage x-ray. I have not heard of any restrictions regarding carrying electronic items. There shouldn't be any reason that an HT would be considered a threat if a cell phone is not. I suspect that they are more concered with things that look like bombs or weapons.

As far as what to do if they question it, I'd try talking to a supervisor or airline representative. If you don't otherwise mind the carry-on being checked, I suppose you could go back to the ticket counter and ask to check it. Of course that assumes that you have adequate time before the flight leaves.

Good luck.

Date: 2001-12-15 22:36:33 UTC
From: Frederick Bray <fbray@mminternet.com>
Message-ID: <3C1BD071.CA0EFF1B@mminternet.com>
Source record: 50501

Take a look at:

http://www.sandman.com/

On that page, he has a link to a telemarketer stopper which explains in detail how these devices work. Basically, most telemarking calls are made by a computer (predictive dialer) which hands the calls over to a telemarker when it thinks it has reached a live person vs. an answering machine, etc. If it hears the tones you get when you call a disconnected number, it drops the number from its lists of numbers to call. Thus, if you have a device which sends these tones when you or your answering machine picks up, the predictive dialer simply hangs up and deletes your number from its list.

I am considering getting one of these things. The last telemarketer who called me called right back after I hung up on the predictive dialer. When I told him that I was not interested in receiving telemarketing calls and wanted my number deleted from the list, he asked me why! I told him that I considered them a waste of my time and hung up again.

7400. Re: Carrying HT on plane

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-15 23:28:10 UTC
From: "Bob Lewis (AA4PB)" <rlewis@staffnet.com>
Message-ID: <u1nn5jjrn9s4b9@corp.supernews.com>
Source record: 50505

It probably depends a lot on the particular security guard. I did get stopped before Sept 11 with an HT in the carry on. First the guard wanted to remove the battery and ship it to me UPS. When I refused to give up my battery he called a supervisor who walked me down to the plane and gave the HT to the pilot to hold. As soon as the security guy left, the pilot handed it back to me and told me to put it in my brief case and don't take it out during the flight.

7401. FS Swan Mark II Linear Amp 2KW SSB

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-15 23:28:37 UTC
From: James Jones <jolenj@earthlink.net>

Johnson SWR Meter & Remote Sensor - Ebay

The remote sensor works with power outputs up to 1000 Watts continuous. This meter works good and looks good. The movement of the meter is very nice.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1308419024

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

7411. Icom 746 vs Kenwood 570S

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-16 03:00:14 UTC
From: Van DeWald <dewald@bellsouth.net>
Message-ID: <3C1C0E3E.388BB83B@bellsouth.net>
Source record: 50515

Folks,

For what it's worth, if you had an opportunity to buy either an Icom 746 radio, or a Kenwood 570S, which would you choose and why? I'm ready to get into HF, and am considering either of these radios for a base rig. Obviously, the ICOM has 2m band. Anyone care to respond to any other features of either that might sway me in one direction or the other?

Both can be had for about the same amount of money, both new and used. I also know that Icom will be coming out with a 746 Pro, so thought I could grab a used 746 from someone who was wanting to upgrade.

I'd be using the radio mainly for SSB QSO's, and would be limited to an HF vertical antenna, such as the Hustler 5-BTV, or something similar.

Thank you for any comments. I would like to read the QST reviews, and will be able to as soon as I get my membership information in the mail.

Source record: 50516

I have an MFJ-9420 QRP CW/SSB 20 meter transceiver in excellent condition with microphone, manual and original box and a MFJ-971 antenna tuner I would like to trade for dual band mobile rig that can be made to transmit at 5-10 watts output.

The 9420 and the 971 can be attaached and made into one unit with the supplied straps.

Please reply to the email address below if you are interested.

Cheers,
Rick

Hi all,
Two problems encountered with my dual bander;
1. When I pressthe right-hand VFO knob to change from one VFO to the other -
it does not change.
2. The TX on the rig seems to have died - eventhough the TX light comes on
and the fan starts.

any ideas on these would be appreciated.

Unless one of the guys is a ham.. then try to explain why you lied...
maybe a concerned passenger may notice and tell the security guy you
lied..
I never had any problems with my stuff. I carry a backpack with
camera, laptop, TS-50 and handheld.. if asked I just say what it is.
Once had a search of our luggage at LAX (days after the TWA flight
crashed near NY) and when they asked what the antenna tuner was I said
I was a ham.. they closed the suitcase and didn't even search our
second suitcase.. Not only did they know what a ham is, they knew
'we' could be trusted :-)

Hi Josh,

I fly several times a week and always take my equipment in my
carry on. I usually have a complete APRS station, GPS, THD-7
etc. and usually another HT or my FT-817. I don't bother to
carry my license except to Europe where I need it for CEPT
operations. I've never had a serious issue. Currently they
seem to be most interested in laptops which they insist be
removed from the case for Xray.

Hi Van,

Check out the following groups. They helped me make my decision between the two.

http://groups.yahoo.com/group/ic746/

http://groups.yahoo.com/group/Kenwood570/

Also the product reviews at www.eham.net were helpful too.

Given the handi-talkies OBLaden and his cronies are seen using, I'm sure the
airport security folks have some training in this area -- before sept. 11,
probably not, but since then, I'd imagine they've been briefed.

Flew Southwest recently with nothing but my cell phone, and got frisked nicely.
I guess I fit the profile -- flying one way, by myself, with one bag...

Anybody know what "SAT. ID" means, when they stamp that on your ticket?

Surprisingly, Radio Shack carries much of the higher-end Fluke gear. Not in their neighborhood stores, I would imagine, but it's there in my paper catalog from Radio Shack, and I'm sure it would be online, too. Look under "Test Equipment."

Hello All,

I have an MFJ-941E Tuner. 160m-10m.

Do you think it would work ok on 6m?

I've tried it a couple of times, it seems to work. However im
not too sure if the unit is giving a true reading & tuning.

Any ideas?

Thanks,

James

Both are good rigs. Myself, I'd get the 746 hands down. Why? The 6 and
2 meters.
And the 746 is no slouch on HF so it's not like you are getting poor
HF to have the other bands. The 570 is a good HF rig, but it's HF
only. There may be a 6m verion of the 570, but I forgot. The 746 would
be much more versatile overall than a HF only 570. I wish they would
add 70cm to the 746, and set it up to allow full duplex for sat use.
I'd buy one in a flash. They have a new 746 coming out, but I don't
think it has 70cm still. I couldn't believe it really. I think a huge
mistake on their part. They would sell like hotcakes as long as they
didn't sacrifice the HF ability to add 70cm. MK

Yahoo Groups is for all practical purposes no different from Usenet Newsgroups or the individual mailing lists at qth.net or contesting.com. You subscribe to what you want.

Just like most mailing lists, you can receive a digest version once a day (or every so often if the group is a low volume one). Or you can forget about the email and choose to view the group online whenever you want to.

They're more suited for folks with an ongoing interest. If all you want are rig reviews every so often, the reviews at eham and contesting are the way to go.

p.s. thanks for the great website!

don p

> about DX'ing....

If you were serious about DXing you would tune your own receiver instead of waiting on other to spot dx for you. Better yet, tune multiple receivers on multiple bands.

If you dont know what you are contributing $$ for, dont contribute. its as simple as that. Your idea of an improvement isnt necessarily the same as others. Perhaps you now know that. Some may feel its of more value to have a cluster that wont crash or that is more real time than one that has all the "bells and whistles" you want.

Some groups require you to register in order to view thier archives of
articles. Upon signing up, you can choose whether to have new postings
emailed to you, or just view them on the groups site. I've expercienced
Zero spam from yahoo groups, and alot of them are very informative.
Eham is nice for reviews, but if you have a niche interest in radio, or
want to discuss things with locals, yahoo works out great!

Actually, Charles may have a real beef, regardless of the opinions of
others about the use of the DX Cluster.
The problem is that he has irritated SO many people with his continuing
SPAMMing of the NGs,that he wont get much sympathy, and has gotten a lot
of flack. (deserved,in my opinion)

As ye sow, so shall ye reap.

"Bob Lewis (AA4PB)" <rlewis@staffnet.com> wrote in message
news:u1nn5jjrn9s4b9@corp.supernews.com...
: It probably depends a lot on the particular security guard. I did get
: stopped before Sept 11 with an HT in the carry on. First the guard
: wanted to remove the battery and ship it to me UPS. When I refused to
: give up my battery he called a supervisor who walked me down to the
: plane and gave the HT to the pilot to hold. As soon as the security
: guy left, the pilot handed it back to me and told me to put it in my
: brief case and don't take it out during the flight.
:
This is what they are supposed to do. It is totally at the
discretion of the pilot. Of course the worst case scenario
would have you leave your HT behind or try to ship it
because some checker was smart enough to know what it
was, and belligerent enough to assume to have the final say.

I would feel a whole lot better that if checked baggage were
required to be searched, that it be done in my presence,
inventoried, insured and sealed rather than being taken into a
back room, rifled and looted side by side with a dozen other
bags at random.

If we are to be asked to rely solely on someone else's human
character, than why would we even need security measures
or even legislators for that matter.

Shouldn't be a problem. Make sure the battery is charged as you might be
asked to turn it on.

7457. Re: Icom 746 vs Kenwood 570S

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-16 20:20:39 UTC
From: John <n1umj@ARRL.net>
Message-ID: <rm7T7.14956$Sj1.8748226@typhoon.ne.mediaone.net>
Source record: 50461

Well, the Icom 746 seems to have a lot of display problems, display lights burning out, actually it is a diode that controls the brightness that if it is over 30% heats up and burns out, besides that the radio isn't too bad. Myself, I have the kenwood 570 and I wouldn't let that go for anything, the radio is incredible on recieve and transmit, no problems at all with that radio, I have run mine extremely hard and I would have to say though it doesn't have 2 meters which I don't get on much if ever anyway, that is most likely the better radio for what I do with it. The CW portion of it, some people don't like the built in keyer on the 570, myself I don't do a lot of CW so I can't really say either way, I haven't had any trouble for the little I have done however, I have found if you turn the noise reduction 2 on on CW, you get no noise what so ever so you can really hear what you want. Other then that I would suggest trying them and seeing which one you like better.

I am Going to Florida so I need some spending cash. Trades welcome as well as offers.
GE MPA VHF System. Aegis encrypted with like new battery and rapid charger. This is my personal radio and I use it for a ham radio and scanner. $350.00
GE MPD UHF standard model 48 channel alpha-numeric display. Nice with little wear. Good battery. $100.00
GE KPC 300 VHF 16 channel scan. good condition with good battery and charger. $175.00
GE MPS VHF 12 channel Like new with new battery, antenna, and charger. $95.00
GE MPS VHF 12 channel Set of 4 that talk to each other and all have new batteries and antennas. All in a rapid rack charger. $400.00
GE PCS VHF 136.-150. 2 channel. I have this on ham frequencies now with battery and rapid charger. $75.00
Midland 70-336B VHF 8 channel 35 watt mobiles with mics. I have 3 of these. $75.00 each
Mastr II Repeater 75 watt in 30" deskmate cabinet. 35 amp power supply and 4 can decibel pas and reject duplexer. Has metering card and factory encode card. com card for talking through the remote. $750.00
Mastr II 75 watt mobile has uhs pre-amp. Painted handle. $75.00
Mastr II Control cable, 8 channel. $8.00 each less the more you want.
Mastr II control head. for mobile repeater operation. $5.00 each
Mastr II mic. $5.00 each less the more you take.
Mastr II tone boards. $5.00 each
Mastr Exec II Mobile extender VHF for UHF Mastr II $20.00 each
Mastr Exec II Mobile extender VHF for UHF Ranger (Ericsson marked) $75.00
Mobile Repeater cable for Mastr II $10.00 each.
Mobile Repeater cable for Delta or Ranger. $30.00 each
GE Voter in special rack with extra rec. cards and test cable. $300.00
Extra Panasonic HHC and power supply for GE suitcase programmer. $60.00
GE MPA, MPD etc. Speaker Mics. $25.00 each
GE MPA, MPD Public safety Mics. $35.00 each
GE PCS speaker Mic. $25.00
GE PCS Universal Rapid chargers. $35.00 each
GE MPA Standard chargers. $20.00
GE MPA Rapid chargers. $30.00
GE MPI chargers with wall transformer. $10.00 each
GE white Versatones 103.5, 162.2, 173.8, 179.9, 186.2, and 203.5. $4.00 each
I need 88.5 and 151.4
GE Mastr II Icoms EC $5.00 each and 2c $12.00 each I do not have many left.
Motorola S1350C wattmeter with 10 watt 500-1000 MHz element. $75.00
Motorola P110 VHF 2 channel with charger needs battery. $150.00
Astatic D104 Mic. Looks new Black base and mic head. $35.00
Want list

Programming cable for Johnson Scorpion portable.
Extra Data module for GE suitcase programmer.
Copies or original data proms for MPS to go in the suitcase programmer.
Dual band Ham mobiles. UHF mobiles that will go in the ham band.
Terms
All prices are plus shipping from 40201. All Items are used unless noted and only have a no DOA warranty. E-mail for any question (You do not have to phone to be serious about buying from me)

7459. QTH.COM supports CB radio?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-16 21:03:28 UTC
From: john <w9jcm@arrl.net>
Message-ID: <A_7T7.5162$6t1.10390@newsfeed.intelenet.net>
Source record: 50462

I have used qth .com for a few years its been a good site until yesterday I saw a ad for "the cbradio Hackers Guide" And this is supposed to be a ham friendly site? Come on well needless to say I posted asking why this was happening and got deleted. Gee who could of guess that? And just got a email back asking why I posted and didn't ask direct. I feel that the promotion of this sort of crap on a so called ham site is outrageous. You my as well change the name to 10-4goodbuddie.com. I understand for the need to get money to keep the site going but this??? NO WAY I will not support that. Goodbye Scott.

john
W9JCM

Below is what i posted:

Heading: CB ads on here?
Ad Message: Why are the owners of this site advertising the CB hackers Guide book? Not to much support for ham radio i say.

I would expect that they lump a HT in the same category with a laptop, cell, gameboy or other similar electronic device, expecting nothing more than demonstrating a function check prior to boarding. Beyond that, if the nice lady in the maroon vest and bowtie feels uncomfortable, you can probably placate her on the spot with your FCC-issued license, quotations from part 97 and the communication skills hams are known for (the first and last points being the most important:)

It would be perfectly legal for a person with amateur HF priveleges to buy
this book, 'hack' a CB Radio, and use it on 10 meters.
Perhaps that's why the ad is there?

Nowadays they may very well make you prove it works as you have
described. They hane been doing that with cameras for years, and
I've had to prove that my turned-off scanner works as a scanner and
not a transmitter when it is turned on.

The worst "security scan" that I've had with carry-on luggage was a
piece of finished gemstone (green malechite) the size of an
egg...must have looked like a hand grenade on the X-ray. And that
was almost 15 years ago.

Having problems with my IC-56 mike. Sometimes the key hangs up and I can cannot find the problem. I take it apart and clean it up, put it back together and it will for awhile before it happens again. This mike has a holdup battery for the memories... would a battery going bad have anything to do with it having constant keying problem?
I cannot find the schematic for it... would it be cheaper to buy a new one than getting this one fixed? Any comments, suggestions or experiences anyone has had with this mike would be appreciated. Tnx. AA4DU

7474. Johnson Matchbox Antenna Coupler - Ebay

Johnson Matchbox Antenna Coupler - Ebay

This is the small coupler, rated at 250 watts. Although it is essentially intact, it has had some modifcations to the back panel (miscellaneous holes drilled into it--I'm not sure why). I've tried to show this in the pictures below. Here are the high points: The coils and capacitors are in excellent condition. The front panel is very good, and the knobs are excellent. The top and sides have some superficial scratches; some through the paint, but not into the base metal. Also, the receive relay is missing (note that with the advent of modern transceivers, most people no longer have a need for receive relays).

Included is the manual, printed in 1953. I purchased the tuner a few years ago at the Dayton Hamvention, but haven't had the opportunity to put it to use.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1307566431

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

7476. Ameritron mobile amp ????

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-17 02:46:13 UTC
From: Gary - KJ6Q <davison7@gte.net>
Message-ID: <V%cT7.1508$ap2.410712@dfiatx1-snr1.gtei.net>
Source record: 50480

I have recently installed an Ameritrom ALS-500 mobile amp - it works great - but I find that if I leave the frequency range in the 20 meter position, it will still function perfectly on 40 meters as well - even tho another range position for 40 seemingly SHOULD be used - any other users seeing the same thing? Any particular reason I *shouldn't* transmit thru the amp on 40 while the bandswitch is in the 20 meter position? The output on 40 remains EXACTLY the same regardless of bandswitch position, and since 20 and 40 are my main bands of operation, not having to actually change the bandswitch on the remotely mounted amp is a definite PLUS - unless there is some reason not to do so...

AND, is there a mobile Ham newsgroup in operation anywhere? Thanks...

If you are referring to the Icom HM-56 mic most times there is an
electrolytic cap that is breaking down with in the mic. A call to Icom
or an email to the amateur@icomamerica.com will likely help you find
out which one is the culprit. I no longer remember which cap causes
the trouble.

I suspect your amp is like one I built years ago - the only reason it had to switch bands was to change the low-pass filters on the output. I think this is true of all SS amps - they have to filter out harmonics.

When you drive it on 40 using a filter meant for 20, you will be passing lots of the 2nd harmonic that would be filtered out if you used the 40 filters.

Greetings, OM's

I've decided to put the antenna tuner project on hold for a bit, at least until after the holidays. Things are hectic enough around here without that project taxing my brain...

Simple question... Has anyone installed one of the SSB filters in an IC-706MkIIG? I'm looking at the FL223 narrow SSB filter presently. Any opinions on how well the filter works? Does it make a huge difference in filtering out adjacent signals? Is it worth the $75?

Thanks in advance, and 73 de AB8LR, Chris

I have installed the 223 filter in my MKllG and while I can tell some
difference , most of the time it is not enough to make it worthwhile.
Just glad that I found it at a hamfest for $ 50 instead fo the full
price. I did install a 350 hz filter in the rig (forgot the number) and
it does work fine. The only problem with that filter is that I can not
select it in the ssb modes. The reason for that need is that I
sometimes do rtty using the sound card softwear and need a filter that
wide. It is not like the old Heathkit sb101 where you could select the
filter independant of the mode. I have not checked it out very well,
but I have been able to tell the Icom it had a differant filter
installed and use the narrow filter in the ssb mode just so I could
select it.

I don't have it, but I hear it does tighten it up a bit. Mainly good
for dx and contest etc. The 1.9 kc filter is a little tight for my
tastes, but it should cut the crud quite well I would think. It will
pinch the audio up a bit. I prefer the default filter for rag chewing.
Better audio. I'm passing on that filter myself and saving the $$$ for
a cw filter. I wish they made a 2.1 kc filter with tight skirts as an
extra narrow filter. That would cut some crud and still leave decent
audio quality. I just can't listen to a 1.9 kc filter for average use.
It it has tight skirts, it will be pretty pinchy. Only for dx and
contest type stuff would I like it. And I don't contest except for FD,
so there you have it... MK

Source record: 50489

I don't know about the newer 706 MK II G. In the original 706, which I have, I don't think the narrow ssb filter is worth the trouble. In the original 706, there is enough filter "blow by" that any advantage is negated. Even on cw with the 250 hz filter, the nose selectivity is pretty good. But, strong signals 4 or 5 (or more!) kHz away leak around the filter causing very high pitched notes kind of in the background. Very annoying and fatiguing.

The same thing happens with the narrow ssb filter, but of course you don't just hear a high pitched tone, you get a cacaphony of crud.

The dsp in the newer 706s might help with this, or maybe a new board design has improved the situation. I have not had my hands on the newer units, so no direct experience.

If you get the filter, let me know if you think it is an improvement.

If this is directed at hams, I see no problem with it. It's legal for
a ham to butcher up a cb as long as it's later used on the ham bands.
It's only illegal to butcher into a cb for cb use. Which do they
advocate? MK

This station is from the estate of K0YTL, who passed away about 10 years ago. Ed's station was operational at that time, and I have just stored it since then. I had intended to set it up, someday, but that day never came. But christmas did! So it's on ebay now, you can be the 3rd owner of this vintage, winged emblem Collins station. The owner's manuals and related paperwork is included. Good luck, and happy bidding.

7499. Wanted - Used Marine Shipboard MF CW transmitter

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-17 17:10:47 UTC
From: Boatanchor Bob NA4G <na4g@weedcon1.cropsci.ncsu.edu>
Message-ID: <9vl8un$8sa$1@uni00nw.unity.ncsu.edu>
Source record: 50405
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I am looking for a marine shipboard medium frequency (400-500khz) radiotelegraph transmitter, any vintage, any condition (as long as it is complete enough to rebuild to operational condition). I would prefer a 60's or later ITT Mackay 2012A, if available, but anything will probably do. I would prefer East or Southeast locations, if available, to ease shipping costs.

Thanks

Bob/NA4G

Body handling: Binary attachment payload not displayed: radioranch.vcf

It has proved very handly to me mobile on 40 meters, especially now that winter conditions have stretched the band out...I still have to use a little shift to get the guys VERY close on the high side, (lower freqs) but its worth the effort...73 Murray K5MDM

Well, maybe they are using Codan -- I haven't seen any pictures, but they ARE
using these 2m toys; we seen that in news pictures.

I'm still trying to figure out where they get electricity out there in the
desert.

Which, with the advent of the TeleZapper and its ilk, they will
now disable. Rendering any such tele-zapper useless -- unless it
causes your M-I-L to stop calling as a side effect.

Yea.. I hear ya.

Its really tight on tuning. I guess its just not made for 6m.

You have to have a steady hand... :)

Hopefully others will share their thoughts on this topic too.

Thanks for your reply Dan.

James,
VA3JPX

Why haven't you persued the protections afforded to you via eBay?

You can file an insurance claim for up to 200 dollars through eBay.
You can file a complaint with Square Trade, and there are complaint
forms for non delivering sellers. Enough complaints, and he will
be eventually NARU'ed from the site.

You seller seems to be basically honest, but his feedback is
riddled with complaints regarding slow deliveries, sickness in
family problems, etc., a lot of excuses for taking months to make
good on sales. There are enough red flags in his
feedback to make anyone thing twice about bidding in one
of his auctions. Caveat emptor. I'm afraid your recourse is through
eBay. Thanks for the heads up on a bad seller, but I think anyone
with any eBay savy would have read the man's feeback first.

My TS-850s/AT developed an intermittent no transmit problem, receive was fine. It turned out to be a DDS IC (part # YM6631 - $23.00) on the Carrier Unit. (there are actually two of these on the board, so I replaced them both while I had the rig apart)

7524. FS: Kenwood TS-430S HF Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-18 01:07:02 UTC
From: "Geo. Encarnacion" <f.v.encarnacion@worldnet.att.net>
Message-ID: <WEwT7.300468$W8.10566980@bgtnsc04-news.ops.worldnet.att.net>
Source record: 50428

This 430S was part of a trade and is in good electrical condition.
Cosmetically, the front panel is nice, very minor top edge wear. The case
has minor scuffs and has a visible scratch close to the right rear case
screw. The rear left and rear right top case screws are not original size.
Looks very nice overall. Tested on the air for several weeks and has good
transmit audio reports. Full output. A good copy of the manual and a DC
cable are included. No mic. Will be shipped in the original double box.

Asking $300, including credit for $10 towards shipping and insurance.
Please email if any questions - ah6bv@arrl.net.

Thanks! George AH6BV / w1

Steve,

I would probably be cheaper and quicker to ditch the HTX100 and go out and get yourself a multimode such as the Titan 10m mobile. They can be had for $99 from Bills 2-Way in Ventura CA. I have had many 10m AM QSO's on mine and it works fantastic. FM is another story though!

7533. Good duplex UHF radio for repeater?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-18 05:34:43 UTC
From: Justin Knerr <kleptein@hotmail.com>
Message-ID: <57lt1u86ldf7fvbt9sprrfs21inlhdn8fs@4ax.com>
Source record: 50437

Our club is in need of a new radio for our repeater.. the repeater is a 440 homebrew, with a no name exciter into a 50W amplifier and a no name receiver both interfaced into a Zetron model 38 panel. The two radios are taking up a lot of space, and the exciter is drifting.

Any suggestions on a small mobile that is easily duplexed and stable?

Well that first post was informative wasn't it? Now on with the show...

Got my W2IHY Noise Gate and 8-band EQ just today. I purchased the fully assembled model along with Kenwood cable. This accessory really gives the op full control over their transmitted audio. I prefer Astatic D-104's and 10-DA's and this unit can EQ those mics to render DX pile-up busting / ear-piercing audio at the flick of a switch. It works great! On the other side of the coin without changing mics I can tailor the audio for a smooth , warm and full sound even on a D-104!
Tomorrow I'll see what can be done with the stock hand mic...should be interesting.
This W2IHY box also has a very nice noise gate. My on-the-air tests qso's were astounded at the reduction in background noise. The decay time and sensitivity of the gate are each individually adjustable.
I suppose I'll be trying the sweet, sexy.smooth sound out too.....this unit is so powerful and versatile you could very well use the same mic for all your needs.....
BTW the unit sits on top of my TS450 and is only inches away from the 811-H. I set things up qrp and did not need to readjust anything for full qro operation. It is RFI bulletproof as the web site says. Here is the URL...

Just nonsense dear OM.
So what you see repeatedly in TV is what you believe and other
information is ridiculous? Oh my god...
Nobody was talking about 1kW handhelds. Only you did! Thanks for this
helpful posting!
Shure these handhelds are used for short distance comm. But there are no
repeaters, ham-made or what so ever!
and did you ever hear about long distance communication with 2m hand
helds over some hundred miles? Maybe thats why they keep their FT23's
high in the air. ;-) These CODAN boxes are working properly as HF
mobiles on a truck. Its THE STANDARD for areas like that.
Keep watching CNN, bye ...-.-

There were different radios for different purposes. For tactical communications on the battlefield I saw VHF radios (FT-23R). That's what was visible on TV. (I saw a northern alliance talking to the enemy across the valley that way).
For strategical communications from command post to command post the codan radios were used. Main reasons were the distance you can cover on shortwave and the availability of the radios. There were numerous NGO's raided to recover codans. At the beginning of the war the talibans just visited all NGOs and left with the equipment.
Several of the bombing mishaps (red cross grain stock bombed, etc.) were due to the same reason. That's where the radios the taliban used to communicate were installed...

7540. Re: Radios used by the Afgans

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-18 12:15:46 UTC
From: willy <willyacht@yahoo.com>
Message-ID: <JpGT7.4618$zB6.2341@newsfeeds.bigpond.com>
Source record: 50444

Like all rebel forces around the world, they use anything under the sun. Going back to the Russiam occupation, there were several pictures in magazines like Soldier of Fortune of Afghans using Icom 2 meters and other radios. There was also a Dutch journalist who was ham who got killed/captured smuggling in Sat Phones, in his kit was a Icom 02a.

The Karen conflict in Burma was another case of ham radio equipment being used for command and control. Numerous Icom radios where used. I even remember seing pictures of Icom 720 radios being used in vehicles. The Karen rebels seemed to like small radios like the Kenwood TS120 series of radios. There operations could be heard throughout the Pacific on various ham bands.

Then there is the conflict in West Papua, and again ham radios are being used for Jungle phones, one picture i saw was of a Icom IC 735 and a Pactor modem. These pictures were widely circulated in the press. Of coarse there was a excellent documentary of the Dutch ham journalist who went and made a film with the West Papau people highlighting there fight. He also was packing a Icom HF transceiver in a Pelican type suitcase with wind up army dipole.

So guys there is enough documented evidence of ham radio equipment being used ina ll conflicts around the world. including Africa. A number of hams have been involved in setting up these freedom radio stations. Why pay big bucks for mil spec hardware, when in most cases the ham gear will do the job. This was certainly evident in Eretrea, Somalia and the other african conflicts.

Theres is enough pictures and media reports of this floating around. I wonder why everyone is so surprised. If you live in Asia Pacific region, most of the HF ham bands sound like the CB band in the 80's. All due to widely available ham gear. Who can remember the 200KM long range phones that were sold in Hong kong duty free shops, featuring Yaiesu FT757 transceivers?

No surprises here, do some research, its all there if you look!!!

Bad idea... I would not lie to these people.

Quite simply say it's ham radio gear and you have a federal license to
own and operate it.

If the person checking happens to be a ham then you don't get caught
lying, and if he isn't he'll know you're legally entitled to the gear.

Personally I've carried a handheld IC-W31 in my carry on several times
when flying to the UK and never had a problem.

Hi all,

I'm searching for a replacement antenna for use on my VX-5R, and I noticed that most replacement antennas are for 2m/70cm. I'd like something that will still allow me to use 6m as well, and I came across the Diamond SRH999. Does anyone have an experience with/opinion about this antenna?

Thanks!

My money would be on two power sources: Diesel/Gas generators, and SOLAR.

Just think about what you'd use to set up an emergency station. There
are a variety of power sources available, among them being gas/diesel
generators (good for lots of HF equipment usage), and
solar/storage_battery/power_inverter (or solar/battery/HT).

7547. FA Nice Miltronix R-390A

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-18 15:53:08 UTC
From: Charles Hugg <chashugg@earthlink.net>
Message-ID: <EDJT7.13961$mF.1446827@newsread1.prod.itd.earthlink.net>
Source record: 50351

This is a very nice R-390A remanufactured by Rick Mish of Miltronix. Please take a look. I also currently have up for auction a Hallicrafters SX-73 and a Heathkit SB-104 Station:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1311008964

Thanks, Charlie Hugg, K5MBX

Hello there,

I've got a batch of Standard Brand UHF radios on 464.xxx Mhz that I'd like to reprogram. I'm under the impression Standard is now sold out to another company..?

Any of your original Standard Dealers able to tell me what the requirements are to reprogram these radios and if the software & interface box can still be purchased anywhere..?

Drop me a reply at the Email address below or take the NOSPAMPLEASE out of the Email reply header above.

thanks

The same two or three companies, generally. I don't recall the names
of them, but they're usually affiliated with the same companies that
do inbound call centers for companies who want to outsource all their
customer service. They're kept just separate enough that the inbound
call sweatshop won't have extra hiring problems from being associated
with a telemarketing sweatshop.

Hi Folks,
I was thinking the other day when I ran across a reference to "open up" the xmit freq range in a new HT. So here goes the can of worms...

Disclaimer: This question is posed as a topic of discussion only with the intent to understand. No hidden agendas, declarations of flame war, or secret malice are intended. This question's posted to a couple of NG's since it can affect either/or.

Why would one bother with modifying ham equipment like this? The obvious answers jump to mind: CAP, MARS, move from the Ham bands for illegal activity, foreign areas with different privileges, etc. But, surely there must be more to it than MARS or "knowing that you could if you wanted to" since apparently so many people are interested in these changes.
Personally, the further you move from the intended use of the equipment, it seems to me, the less effective the xcvr becomes. So, why bother?
There it is. Serious, non-attributive replies are appreciated

I am purchasing a new VX-150 (can't beat the price), and I'm interested in a NiMH battery pack for it.

I see that Batteries America has the FNB-V57x on special for $40. Anyone have the battery? What do you think of it (performance, fit to radio, etc.).

I'd also be interested in any comments regarding accessories for the VX-150.

Thanks in advance!

Drink,

This is an excellent question, and one I have pondered myself. I only considered modifying my HT once....it's a fairly unique situation, but since you asked....:-)

I am a ham and also Principal of an Elementary School where 90% of my 620 students arrive by bus transportation. The Transportation Department communicates at 155.something and I usually bring my HT to school on the first few days in September to monitor the chatter, as there are always delays at the begining of the school year. I have sometimes thought that, in case of an emergency, it would be good to be able to talk to one of the bus drivers. Right now I have to call the Transportation Department on the phone, and they relay a message to the bus. Yes, I could request my own commercial radio, but with school budgets the way they are, I have considered simply snipping the 3 solder joints on my HT necessary for me to communicate in case of an emergency. Just my 2 cents.

As a brand new ham, I still remember several test questions relating to disaster communications, etc. Here is my interpretation and 2 cents.

I understand it is acceptable to use ANY frequency to communicate a disaster. I also understand one should never interfere with police and rescue communications.

A modified HT might enable me to communicate directly with the police and/or EMS in the event of someone near me having a heart attack or other life-threatening situation. Since I no longer have to leave the victim, find a telephone, make the call, hangup the phone, return to the victim, then hope the EMS team can arrive and find us, it is likely those valuable seconds/minutes could save someone's life. I'll take that chance any day. After all, don't many of the HAM activities revolving around emergency preparedness?

We have the ability to do much more damage with a firearm, automobile, commercial airplane that most of us with a modified handheld. Like my examples, I think owning a modified HT requires maturity, good sense, and self control. Most of the HAMs I've met exhibit these qualities. The ones who do not will probably be a menace in other ways.

Regards,
KG4QJM

Number one, it is silly to carry around TWO radios, one for ham friend, one to talk to friends with FRS radios. This way one radio does both.

Also, since in an emergency, a ham can use any frequencies available, why not make sure you can transmit on any frequency. The ham repeaters may have no one listening at 4 am, but the police dispatcher will be. If it is a matter of life and death, you can deal with the legal crap of transmitting there later.

There are several other reasons, but the way to think about it is this...

Why put a restraint or limit on something if you are responsible? Who knows why or when you would need to transmit out of band, but when you are in a situation when it may come in handy, you won't have your screwdrivers and soldering irons around. Do the mod, and just don't transmit on the frequencies.

Sort of like having a car that could drive 100Mph and then putting a chip or resistor in the engine so that it could only drive 55. Or a limit to the 60 gallon gas tank so that it will only take 40 gallons.

I'm not going to be the one who one day can't do something because there is no need to have something in the normal day's routine. Like the Boy Scout, I am prepared at all times. I carry a pocket knife too, most days I don't need it, but when I do, it sure comes in handy. Same with my flashlight that everyone at work comes up to me to borrow.

> Why would one bother with modifying ham equipment like this?

Many hams endeavor to have as many capabilities as possible
in times of emergency. The ability to transmit out of band is one
of them. On two seperate occasions, I have seen this done right.

During the 1991 fire in Oakland, California in which dozens of lives
and 6000 homes were lost, I was very busy monitoring the traffic.
I was very familiar with the area as the fire came within two blocks
of my mother's house where I had grown up. I heard the Red
Cross Commander, who was clearly not local to the area,
unknowingly send his troops up a canyon that was soon to be
surrounded by fire (I was also monitoring the California
Department of Forestry). It was clear to me that he had confused
Claremont Country Club with Country Club Drive. I keyed up
on 154.something and briefly informed them of the mistake.
They checked the maps, cancelled their orders, and were very
thankful for the help. They never asked me to identify myself.

The other time that this was helpful was during the 1995 flood
on the Russian River. The Sheriff (UHF) had a desperate need
to communicate with the local fire department (VHF). I was
with the fire department, and we were inaccessible (except by
boat or helicopter). The solution was to have the Sheriff and
the fire department each dedicate a channel to inter-agency
traffic, and a dual-band mobile radio was taken to a mountain
top that had a generator where it was put into cross-band mode.
Everybody was happy, and as soon as the emergency subsided,
the cross-band mobile radio was retrieved.

I have heard of many such adventures in amateur radio.
Hang out with your local RACES or ARES folks,
and you will hear them as well.

However, the police will typically look at any unauthorized transmissions on their frequencies as false and/or deceptive info. If they answer the person at all it will only be to keep them talking long enough to find and arrest them.

By the time they figure out that the info is valid, the injured person(s) will already be dead. Best to use your HT to get a ham with a land line to call 911 if you want to be taken seriously...

FRS is close enough to 70cm ham that I could use my HT in an emergency
to try those frequencies. Sure, I could just carry a one of my FRSs,
but if the situation has already gone bad, I'd rather not waste time
trying the few mW from that, and just go ahead with ~5W.

Same goes for MURS; if I can't get ahold of a ham, I'll settle for
announcing my emergency over the Taco Cabana drive-thru system in
hopes that the next customer will have a cell phone handy.

>Why put a restraint or limit on something if you are responsible?

That's the key, if you are responsible. I do get the impression that many of the people asking for "mods" are irresponsible squirrels. They rarely give a reason for wanting a mod -- in many cases it is simply a general, "Anybody know any mods?" type of thing, and you never know whether you're doing more harm than good when you give out modification info.

On top of that, considering how common cell phones have become, I'm not sure I see the need to even use a handi-talkie, and to get on police frequencies. The last time I saw a car accident, eight or ten people suddenly appeared at the intersection, running toward the wreck, all calling 911 on their cell phones.

Actually, they do. One of my clients is a large telemarketing company, with about 3,000 employees. The company, itself, sells nothing. It simply provides a telemarketing service to other companies that want to push some particular good or service. So if your name is excised from the phone lists at W**t Telemarketing, none of the companies that utilize W**t will be offering their goods or services to you.

One stone kills a lot of birds, here :-)

Heathkit HM-102 SWR Meter with Remote Sensor - Ebay

This meter is in excellent condition. It has both 200 watt and 2000 watt power scales, as well as the SWR scale. The sensor box can be mounted into the back of the meter so that it is self-contained, or is can be mounted remotely where connections may be made more conveniently. Cosmetically, I can't find a thing wrong with it. The original manual is included.

This is a quote taken from one of the Heathkit enthusiast sites:
"The HM-102 is perhaps one of the most popular accessories Heathkit ever made. They sold zillions of them. The HM-102 is a RF power meter that will measure up to 2000 watts of RF. The HM-102 will also measure the Standing Wave Ratio between the transmitter and the antenna. The HM-102 is designed for use with 50-ohm transmission line only. The removable pickup can be placed up to six feet from the meter. No external power is required for the HM-102."

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1308104048

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

That will work! First they will have to save his life, then they can arrest
him.

At any rate, calling for help out of band will be far more effective than
using morse code in band.

VERY bad idea. That comes off confrontational.

Just tell them it's HAM radio gear, you have a license, and you need it
at your destination.

No way imply at ALL any operation at ANY time, even 'just' receive,
aboard a commercial carrier. You do NOT have any right to do that
AT ALL under the FAR.

I'm a member of the local FD here. While it would not be our 'standard' to
issue or encourage amateur radio equipment to be used on the frequencies,
I can assure you that if I happened upon an emergency, and contacted
dispatch with my amateur rig, no one would question it. This way I can
direct any responding units, and not have to carry two radios. Mainly
though, I just like the extended recieve, since that way I can scan all
local FD freq's for activity.

Here's a bit of info I'll share with you: I had a YG-455C (old solder-in style) in my TS-850. It worked, but with a quirk: I had to increase the Low Slope Tune to about 10 o'clock position, otherwise I wouldn't hear anything (when the filter was turned on).
I suspect the center frequencies of the YG-455C and the YG-455C1 (the official 850 filter) were not precisely the same. I recently replaced it with the C1 and no longer have to tweak the Slope Tune. Otherwise there is no difference between the two.

Having said that, I have no idea how the other IF filters are going to work, but I thought you might want to be aware of the fact that apparently the 455 kHz filters were not identical electrically (not to mention physically). Try before you buy.

Money.
For less than $300.00 I can have a radio that lets me communicate with the volunteer fire department I'm part of AND talk to the incoming ambulance on a totally different band if needed. Nobody else can do that.
I can also hit the search and Rescue frequencies and coordinate with FRS radios in local searches.

During the summer I can carry one radio and work festivals with business and FRS radios.

I do scrounge a lot of good food at the festivals and get to ride in big red trucks the rest of the year but I get nothing else from the work.

The PCB that the plug-in filters for the TS-850 are mounted on provides
the proper impedance matching, and I suspect it was the lack of same
that cause this problem, rather than the actual filter itself.

I think you can remove one of the plug-in filters from its PCB and
solder it into a rig such as the TS-440 and it will work fine. Going the
other direction is a bit more involved.

> Ich bin ein bishin neugierig - was ist ein Rothammel?

Das ist ein gutes Antennenbuch, inzwischen in 12. Auflage erschienen,
man spricht sogar vom deutschen Standardwerk. Das Inhaltsverzeichnis
steht auf http://www.darcverlag.de/rothammel.html, Leseproben auf
http://www.rothammel.de/ - man kann das Buch AFAIK auch ueber
Amazon.com bestellen und ueber den Buchhandel.

Urspruenglich ist es von Karl Rothammel verfasst worden, jetzt wird
es von Alois Krischke bearbeitet, beides Funkamateure.

73, Jan-Martin

RADIO HABANA CUBA
DXERS UNLIMITED

MID-WEEK EDITION
TUESDAY, DECEMBER 18, 2001

By Arnie Coro CO2KK

Send your comments, questions and ideas to: arnie@radiohc.org

Hi, amigos! With less than 2 weeks left of the year 2001, old man Sol, our nearest star, continues to provide radio hobby enthusiasts with very nice propagation conditions.... Early morning Tuesday local time in Havana, I was able to pick up some interesting signals that indicated a very fast rise of the daytime maximum useable frequency curve.... and although solar activity is expected now to move down for the next few days, the fact is that there is so much ionization at the higher levels of the ionosphere that free electrons are really plentiful, even after the Sun sets.... Solar flux still above the 200 mark, and the effective sunspot number has now moved down to around 160, still an impressive figure by all standards...

Item two: I have just updated my list of all the ways that you and I may enjoy our wonderful hobby!!! And it has grown to 63 different and clearly identifiable ways of having a nice time with our hobby, from monitoring natural radio signals on the extremely low frequencies of ELF to playing with LASER BEAM communications in order to add points to your station when participating in a VHF-UHF-SHF amateur radio contest.... And don't forget such nice ways of enjoying the hobby as antique radio restoration, radio kit-building, computer-aided design of antenna systems, building amateur radio equipment from original designs and some very interesting aspects of the radio hobby like doing intruders watch on the amateur radio bands to help keep the ham bands clear of illegal users !!!

Yes my friends, the list now adds up to 63 different ways you and I may enjoy the hobby....radio has the unique feature that it is a never-boring hobby .... with some aspects of it costing next to nothing, like the way many of us seem to have started here... SHORT WAVE LISTENING, the flagship of all radio hobbies!!!!

Item three: You have questions and Arnie answers them section of Dxers Unlimited will reply today to a question sent by several listeners in relation to the so-called coaxial cable antenna, a very

easy to make dipole that requires just a length of coaxial cable and one antenna connector, plus a small length of PVC insulating electrical tape and a small amount of silicone weather sealant, and as always at the end of the show, I'll provide you the most up to date HF propagation update and forecast which, even when heard during our late-late show at just after 0530 UTCm is never more than 12 hours old....

Stay tuned right on this same short wave frequency or if you are listening to me on the world wide web streaming audio, keep your computer connected to Radio Havana Cuba... Margarita Delgado is my sound engineer and producer , I am Arnie Coro, radio amateur CO2KK, back with you in a few seconds...

This is the mid-week edition of Dxers Unlimited, you can always reach me via e-mail by sending your message to arnie@radiohc.org and I will reply to you directly with an answer to your radio hobby-related questions as soon as I see your message displayed on my computer screen....

Now here is item three, our popular YOU have questions and Arnie answers them section of the show.... Today, I will be answering a question sent in by listeners in Cuba, Canada, the United States of America and several European nations, plus Australia... The question has to do with a very simple way of making a low-cost yet effective dipole antenna, that has proven to be very useful for portable work in the frequency range from 10 meters all the way up to the 2 meters amateur radio bands, and all frequencies in between.

This coaxial cable dipole, can also be made for lower frequencies, but it is a bit more troublesome to do the tricky operation of pushing the coaxial cable braid back over the outer jacket of the cable for a length of more than about 2.5 meters or eight feet required for the 10 meter band version.

The "Coaxial cable push back dipole," as it is known among radio amateurs, is an excellent emergency antenna for the 10, 6 and 2 meter bands, and ranks among the lowest-cost skywires that the radio hobbyist may build and install, as it only requires enough coaxial cable and an antenna male connector.... The coaxial cable push back dipole is one of my favorite portable antennas for the 2 meter band handie talkie when travelling, as it has the advantage over the 300 ohm TV twinlead J pole, that it is smaller in length and does not require any soldering at all... something that has helped me to build these antennas even right in the middle of a communications emergency with the help of my faithful pocket knife, if a length of coaxial cable with a connector at one end was available from a broken antenna... The only thing needed is that one end of your coaxial cable will have an appropriate type of antenna connector for the radio that you are using soldered to it.... Now, ready to copy, ready??? Here is how to make a coaxial cable push back dipole following these easy step-by-step instructions:

First calculate the length of your dipole antenna for the center of the frequency band you want to operate your radios on... Here is the formula: Divide the number 143 by the frequency in megaHertz, and your result will come out in meters... For example, let's make a coaxial cable push back dipole for the 2 meter amateur band.... Center frequency: 146 megaHertz.... so -- very easy -- divide 143 by 146 and you will find out that the overall length of the dipole, of course, your result will be less than one meter in length, exactly 979 millimeters, or in round numbers 98 centimeters.

Now, step two: Very carefully remove the outer plastic jacket of the coaxial cable for a length about one and a half meters, to make things easier for the next step. That is, strip the cable of its outer jacket for roughly one and a half meters and then proceed to fold back the coaxial cable shield or braid over the cable's plastic insulation, in a way similar to what you do when you are removing your stockings.... The braid will then leave a length of the center of the coaxial cable exposed to form the other half of the dipole antenna....

Step three is a very easy one: Just trim the braid that is over the coaxial cable's outer jacket so that it will be 49 centimeters long... And also cut the center conductor to slightly more than 50 centimeters, so that you can trim it later for minimum standing wave radio in case you want to transmit with this antenna...

Step 4 is also very simple: Find a length of PVC plumbers pipe of about 100 millimeters or 4 inches long, and just wind as many turns of the coaxial cable as will fit, starting from the point where the shield or braid ends. This is the coaxial choke balun, essential for the proper operation of this type of antenna....

As you may realize, this is just another way of building a half wave dipole antenna, so its gain, compared to a standard half wave dipole will be zero db d, or zero decibels over a dipole, as this is the reference antenna for practical radio work....

By the way, you must install the antenna according to the polarization used by the stations you want to listen or talk to, so in the case of the two meter amateur band FM, the coaxial dipole must be installed vertically, as by convention, and to facilitate communications with mobile and hand held stations using vertical antennas, the 2 meter FM amateur sub band stations all use vertical polarization.

Of course that you can make a coaxial cable push-back dipole in just a few minutes for any particular frequency in the range of from about 25 to 250 megaHertz, by applying the formula, and proceeding to first remove the outer plastic jacket for enough length, pushing back the shield or braid over the cable's plastic jacket, and trimming the length of the center conductor and the exposed braid to the appropriate length to make the dipole resonate. Don't forget that the coa_ial cable choke is essential for the proper operation of this

antenna, and here I must add that the choke for the lower frequencies in the range from 25 to 50 megaHertz must be wound on a length of PVC pipe of no less than 3 inches in diameter, that is 75 millimeters, winding at least 8 turns. In the range from 50 to 100 megaHertz reduce the diameter of the pipe to 2 inches, that is 50 millimeters , and as mentioned previously for the antennas in the range from 100 to 250 megaHertz, the coaxial choke diameter must be one inch or 25 millimeters.

I have done some experiments regarding the number of turns required for optimum operation of the antenna, and it is between 6 and 8 turns... Please notice that this coaxial choke is just the same cable wound over the PVC pipe "coil form" to effectively isolate the antenna from the feedline.

By tying a nylon fishing line to the end of the exposed center conductor you can install the coaxial cable push-back dipole vertically at any location, for example, it may hang from a tree branch, or supported by a plastic or wooden mast...

If you want to use the antenna, as I do here, as part of your permanent receiving or receiving and transmitting station, then carefully seal the place where the coaxial cable shield or braid separates from the center conductor by winding several layers of plastic insulating tape, and then sealing with silicone compound....

Many Cuban radio amateurs use this antenna for 2 meters FM by placing the dipole inside a length of PVC pipe for additional weather protection, but they soon found add that the presence of the dielectric so near to the antenna changed its operating frequency, so the length had to be trimmed experimentallly for minimum standing wave ratio...

Si amigos, yes my friends, oui mes amis, one of the easiest to make and lower cost antennas -- the coaxial cable push back dipole is an excellent performer, and all it takes to make one is a length of coaxial cable, an antenna connector of the type used by your rig and some plastic PVC insulating tape and a bit of silicone sealing compound for the portable version of the antenna.

An antenna for permanent, fixed, station use will be better protected if placed inside a length of PVC plumbers pipe of about 25 to 50 millimeters diameter, but again, you must carefully trim the length of the center conductor half of the dipole and of the braid for minimum standing wave ratio!!!

Any doubts, any doubts on the how to make your own coaxial cable push back the braid dipole? Then just send me an e-mail and maybe I can send you a nice .jpg picture of yours truly and the most recently built antenna!!! Send mail to arnie@radiohc.org or VIA AIR MAIL, a postcard is fine, to Arnie Coro, Radio Havana Cuba, Havana, Cuba.

And now as always at the end of the show, here is Arnie Coro's HF plus 6 meters propagation update and forecast: Solar activity moving down now, but still high enough to support very high daytime maximum useable frequencies, amigos!!! There is still one solar active region with the complex magnetic configuration required to produce solar flares. Running typical HF propagation forecasting software is not that difficult at all, and at least one of the most recent ones is absolutely freeware and works very well... it is W6EL's brainchild, and Sheldon C. Shallon, radio amateur W6EL, who owns the copyright, but kindly has made the program available free, in the public domain...

Well a test run of the W6EL's HF propagation software that I did just before finishing to type this script showed that the maximum useable frequency from Havana, Cuba to Buenos Aires, Argentina stays above 30 megaHertz from 13.30 UTC to 22.30 UTC, reaching a peak of 38 megaHertz at 19 hours UTC, so you see what I mean, the second peak of solar cycle 23 is doing a very good job to push those daytime maximum useable frequencies way up... Enjoy them amigos, and don't forget to try our new streaming audio from www.radiohc.cu!

I am selling my Icom IC-T7a, dual band hand held, it is in excellent condition and works very well, the battery life is amazing. It has had a modification at some stage to expand the tx range and seems to work well on 477 mhz if thats an interest. It comes with a well presented copy of the manual, a desk charger a speaker microphone and two antennas, I think one might be specific for the 477 mhz band but not to sure,, $350

I suspect that many people refer to the IsoLoop clones as IsoLoops in much the same way that many people refer to all colas (and, in some locales, all carbonated beverages) are referred to as "Cokes", or the way photocopies are generically referred to as "Xeroxes"...

7600. Re: will a solder-in filter work instead of the plug in type?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-19 13:05:54 UTC
From: "Geo. Encarnacion" <f.v.encarnacion@worldnet.att.net>
Message-ID: <Sg0U7.172256$WW.10829442@bgtnsc05-news.ops.worldnet.att.net>
Source record: 50304

The YK-88SN and the YK-88SN-1 (filter only) are identical in electrical in/out Z, bandwidth and center frequency. The only diff is one is solder-in, other is plug-in. I found a "bypass" filter board at a flea market once - same size/socket config as the 8830 IF filter boards. It had a single slug-tuned transformer and resistor. I gutted it, save for the sockets and installed an SN solder-in filter on it (with some PCB trace changes) and swapped it in for the YK-88SN-1 in a TS-570s(g). Swapped them in/out several times - they are identical electrically.

Aside from the obvious solder-in/plug-in diff, the CW and AM filters have different electrical characteristics! The plain YK-88A, YK-88C or YK-88CN have center frequencies of 8830.7 KHz. The -1 filters are 8830.0 KHz. This also holds true for the 455 KHz IF filters - YG-455C, YG-455CN have 455.7 KHz center freqs., the YG-455C-1, YG-455CN-1 have 455.0 KHz center freqs.

Hope this helps,

George AH6BV / w1

In my case, three radios?. No thanks. I am not a ham yet, but am planning
on it since I learned of their versatility and extra comm that would be
available. I got into the modified radio as a small inexpensive radio that
I can use on 4-5 business frequencies as needed when I am contracted to
those businesses. And still need to have a cb. Personally would rather not
have any of that junk hanging around in the cab of my truck, but since I
have to have it, it will be kept to a minimum.

Why the heck did you need to toss in any comments abt Morse code? I see no connection the conversation here. what I do see is some very interesting and justifiable reasons for expansion on ham radios. I also see some, shall we say, silly reasons. The "I don't want to carry 2 radios" reason is a bit lazy. But to each their own. I do know that the fire dept. and local EMS in my area would have a hissy fit if they found one of their people using anything other than approved radio equipment...

Just my rant....YMMV

Dan

I have for sale a really nice Icom W2A Dual Band, 2meter/440 handy talkie.
This HT works great and looks very good. It comes with the wall charger,
manual, original box and two very good NIMH Batteries:
1. 1500 mah Nickel Metal Hydride battery (BP-83 size);
2. 1700 mah Nickel Metal Hydride battery (BP-84 size).
Price for above item is $160.
I also have the following Icom accessories for the W2A for sale:
1. BP-90 AA Battery Case. Price is $20;
2. CP-13 Cigarette Lighter Power Cable. Price is $15;
3. Icom HM-65 Speaker Mic. Price is $20.
I will the whole package including the W2A HT and all accessories for $195
plus shipping form 79602.
Thanks, Charlie Hugg, K5MBX

I've got a VX-150 with both the stock NiCd and the AA dry cell battery holder.
The NiCd lasts 8-10 hours and the AA battery holder full of RAYOVAC
NiMH batteries (from the local Wal-Mart) lasts 24-30 hours. :)

Now I just use the stock NiCd for a back-up battery
BTW I bought my dry cell battery holder from Universal Radio @
http://www.rffun.com , they had the best price on them I could find.
And the evil empire sells the NiMH for around $6 a pair. And of course
you'll need a battery charger, but that's the best way to go.

That's no doubt true in the PRK and other urbanized areas but I know the
good old boys hereabouts thru ARES and I'm certain they would respond to
the emergency first ... then lock me up for using their freq's :o).
OTOH, none of my gear is modified.

I've had this for 42 years, since it was given to me by one of my dad's co-workers, and in all that time it has had a homebrew weight I made from bar stock. I'd really like to put a genuine J-36 weight on it, or a stock Vibroplex weight, if someone has one to sell.

Does anyone know if the stock Vibroplex weights will fit it? If they do, I'll be making a call to Vibroplex PDQ.

Thanks.

I have the Diamond SX-100 watt meter that works great but the bulb is out. I want to use it at my low band station and need a lighted meter. Almost everyone I talk to with the meter say the bulb blew out right away and most never replaced it. It's distributed by RF Parts
and they won't send me a schematic but will send the bulb (said they would 2 weeks ago). Is this a normal problem or have I run into a skewed universe???

7624. VHF rig that will fit a 2002 Honda Civic

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-19 23:14:27 UTC
From: LHBradley@igs.net
Message-ID: <3c211e18.82088487@news.igs.net>
Source record: 50328

G'day. Just bought a new Honda Civic, and want to put a 2 meter (or a dual-bander) in it. My old Kenwood rig is too damned big, so I want to replace it with something that will fit.

Any Honda Civic owners out there that want to offer suggestions as to how to mount a rig in a Civic in general, or what rigs they are using?

Are the removable face rigs a better idea than the fixed rigs from a mounting point of view?

How about getting 12 VDC to the rig?

All suggestions gratefully appreciated.

Source record: 50332

Larry:

I managed to make a nice installation in my 1997 Civic. I don't know how different it is from the 2002.

I bought my Civic without a CD player. The place in the console where the CD player would go was filled with a mostly useless plastic "pocket".

I removed the pocket and, with two extra pieces of bent sheet metal (homebrew!), I was able to install an Icom mobile mounting bracket in the console behind the opening. I forget which Icom it was (I'm no longer using it.), but I think it was an IC-21(???) Anyway, it made for a nice neat installation with the rig embedded in the console.

When the Icom died, I replace it with a Kenwood TM-241A, which happens to be almost the same size and slides nicely into the Icom mounting bracket.

Getting power leads from the battery to the rig was easy. I just forced them through the firewall alongside the wires in an existing grommeted hole. I used a trunk-lip-mount for the antenna, and easily ran the coax through the back seat and under the mouldings along the floor on the passenger side. So all the wiring is well hidden.

The only drawback I've faced is that I can't open the cup holder when the microphone is plugged in :-)

Hi Chris,
Now there's one I hadn't considered. Actually, I wasn't considering HF
radios since there seems to be more "valid" reasons to modify them. Using
an HF rig to transvert up to 2m is thinking "outside my box":) though.

You don't know what "lazy" means to make a statement like that. It is not "intelligent" behavior to carry around two radios when you can get both requirements in one. Is it lazy when people have both AM and FM in one car radio rather than put two radios in the car?

Why not carry around 24 radios to show that you are not lazy? Why stop at two?

Try it sometime. You have a headset and mike for one of the radios and the
other one is, if you are lucky, small enough to fit high on your chest so
maybe you can hear it if somebody calls in the loud environment you are in.
It is a real pain. One radio able to scan and be flipped rapidly works much
better.
If both radios are big, then one will be on your belt and you will not hear
it a lot of the time.

But to each their own. I do know that the fire dept. and local EMS in
> my area would have a hissy fit if they found one of their people using

Where I live the fire department is the first responder in the EMS system,
as it is in most if not all of California. (We don't count the cops who
frequently do get there first but just stand around.) Since this is an all
volunteer department, nobody's going to complain if I save the department
$700.00 or more dollars for just one radio.

The Yaesu FT-90 is extremely small, dual band. I've seen some complaints
about heat problems, but most of those owners stuffed the radio in a cube
or cubby that had little or no circulation.

Hi All,

Can someone tell me where I might be able to get a replacement relay
(I think its RL1; its in a small clear plastic box and resides next to
a couple of big capacitors below the VOX board) for my TS-520?

Any help would be appreciated.

>..process of elimination is leading me to believe that the speaker
>wires on my home stereo are resonant around 7KHz.

I had a similar problem with my stereo set-up... I put those Radio-Shack split-core chokes on the leads and problem disappeared. Mine have about 8-10 turns orf the speaker wire around the choke and the chokes are located within a few inches of the reciever's output terminals. NO RFI!!

Nothing happened that they knew about. Maybe they interfered
with equipment the pilot didn't need to use at the time (like
during cruise at 30Kfeet). Or the pilot had a backup he
switched to. The pilot may have figured something broke
down and he'll have it fixed/swapped out at the next airport.

I've heard stories of a flight during the Superbowl where passengers
listening to the game on radios caused interference with pilot
equipment. And that is just LO leakage, not intentional emitters.

I got a Kenwood G707 into the half-DIN leftover slot in a 99 Kia with
no problems and plenty of room to spare. If I get around to covering
the gaps at the sides, and redrilling my homemade bracket to let it
sit farther back, it will look as good as any factory install I've
seen. The 707 is well suited for this setup, since it has its own
fan. The airspace back there has plenty of clearance to both
floorboards, but no movement without something to give it a push.

The removable faceplate still works just fine as an anti-theft device
even for in-dash mounting, and allows you to keep the LCD out of
direct sunlight.

7645. Marine SSB as ham radio? Need for ATU?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-20 12:14:05 UTC
From: cprstnc1zz@optonline.net
Message-ID: <3c21d4e2.772487@news-server.optonline.net>
Source record: 50248

Three questions from a rank newbie, still waiting for delivery of his
first test prep materials.

(1) Can an HF marine radio like the SEA 235 serve as a ham radio?
See: http://www.sea-dmi.com/marine/sea235.htm

(2) Can a ham radio like the FT990 or IC765 serve as a marine radio?

(3) If your radio does not have an automatic antenna tuner, does this
mean you must tune your antenna every time you change frequencies?
For receive and transmit?

Ken

Date: 2001-12-20 13:32:46 UTC
From: cprstnc1zz@optonline.net
Message-ID: <3c21e776.5528829@news-server.optonline.net>
Source record: 50250

It turns out to be more complicated than I thought, but I think I have
some answers. Would someone kindly confirm?

-The marine bands and the ham bands do not overlap

-There are marine radios that operate on ham bands (e.g. ICOM 710),
but they lack the "big knob" that lets you tune to a signal.

-Ham radios like the FT990 can be easily modified to operate "out of
band," but doing the mod or using the modified radio on the marine
bands is technically unlawful. It is OK in an emergency.

-There are separate licenses for ham and marine.

-Most ham radios will not stand up in a marine environment because
they have steel components and the connectors are not tinned.

From: cprstnc1zz@optonline.net
Message-ID: <3c21e937.5978467@news-server.optonline.net>
Source record: 50251

One more point:

-Some marine folks say that a ham radio operating out of band is imprecise and has a lot of "splatter." Others say that they are as precise as the marine radios, but the manufacturers just don't bother to have them certified. Which popular, good used ham radios will do OK of operated out of band? The FT990?

If those tales are true, the aircraft industry is in deep trouble. I operate a laptop & 50W 2M packet station while my child bride hunts DX on a 100W HF rig beside me with no mutual interference on cheap consumer equipment and I have a tad of knowledge about the immunity of military gear. OTOH I read that airport radars are often down for months waiting for obsolete tubes at the same time the military is scrapping 3D radars only one generation old so I wouldn't key up on an airplane either.

Hi, I'm new to hamming, and taking the test on January 17th for my Tech License. But this strikes me as funny I guess. One would wonder why Ham Radio would be immune to any of the "human" things affecting so many other aspects of our lives. How many people drive 20 miles over the speed limit and claim "nothing bad has happened so far"? Or for that matter, in most every thing inlife there is that faction of folks who believe they are above the "rules".

Isn't the point of Ham Radio supposed to be that it is inhabited by people who have the common sense to police themselves?

Because when it comes right down to it, I'm getting my ham license because I can't stand the snake pit of Citizen Band and I want to be involved in radio where people make a difference to the hobby.

Maybe, when someone claims they have used their rigs on a plane with no ill effects someone should mention to them that, while true they may not have noticed it, by claiming such they are making a mockery of the entire Amateur Radio mission.

Get the remote mounting items (3 or 5 meter cable and head mounting bracket, possibly the interface box and a second cable). I have a Chev. Cavalier, not a Jeep, but this worked good for me. I stuck the mounting bracket in between the top of the center AC duct and the dash, holding it in place with a piece of 3M double-sided foam tape, and remoted the radio up behind the center console, out of the way. Works really well, the head is easily visible and accessible.

I posted an auction address for a President Lincoln HR2510 earlier.
The address has changed to

http://www.2wayradioauction.com/cgi-bin/auction.cgi?mobiles_amateur&1009053525

Thank you for your understanding.

And what would happen when the music happened to hit 7KHz?

Somebody musta slipped a decimal point or three.

I was replying based on the 'perception' that someone making the statement the way it was posted was confrontational and just 'sounded' like they felt they had the right to operate aboard an aircraft.

I personally HAVE operated. RX only, and with pilot interaction. He wanted to know when I turned it on, and when I turned it off. But this was many years ago, 1981 to be exact, and now the rules are, I believe, even stricter.

Others say that they are as
>precise as the marine radios, but the manufacturers just don't bother
>to have them certified.
>Ken
>(to reply via email
>remove "zz" from address)

The Marine SSB transceiver for sale in and to be licensed within the United States must meet the technical requirements of FCC Part 80 to end rules.

One part of the technical requirements is the transceiver must be accurate to within 20 Hz, no amateur transceiver is that accurate with out some sort of crystal oven. Also the Marine transceiver is not allowed VFO control but is channelized. Where the Amateur transceiver is allowed VFO control. There are also spectral purity considerations the Marine SSB transceiver must pass.

The Amateur transmitter is NOT tested by the FCC or a testing lab for spectral purity, only the manufacturer must test and make sure the amateur transmitter meets FCC Part 97 technical requirements to sell the Amateur transmitter with in the United States. The Amateur manufacturer who builds HF only transceivers follows the same rules you would if you home brewed your transceiver, only the manufacturer does notify the FCC how many transceivers are imported monthly.

Amateur Transceivers with Scanning receivers that scan two or more frequencies an operate above 30 MHz get caught by FCC Part 15 rules for Scanning receivers. These products only the receiver is tested for spectral emission's again the transmitter is NOT tested by the FCC or a testing lab. Amateur transceivers in this category are Granted Equipment Authorization. here you will see the receiver range the manufacturer asked for Certification on.

For example for the IC-706 MK2G the receiver is certified to operate from 30 - 200 MHz and 400 - 470 MHz . Any opening of the receiver beyond this range violates the Grant of Equipment Certification, the manufacturer can't sell an IC-706MK2G with a wider receiver range unless they resubmit it for another FCC test and a new Grant of Equipment Authorization. The FCC then would have to check the test results and Grant another Certification. It does get involved and costly.

What it means to the amateur operator who opens his receiver and the receiver radiates causing neighbor's TV etc interference I don't know. As once you open the receiver it no longer meets the FCC Part 15

Certification the transceiver was sold under. I suspect the Amateur would then assume responsibility for the receiver and it's radiation.

Amateur HF amplifiers are the only amateur radio product that is Type Accepted. This is to certify the HF amplifier does not amplify transmitted signals form 24 to 28 MHz from the manufacturer.

Try a simple experiment. Assuming you have a scanner or Ham rig capable
of monitoring the 108-118 portion of the aviation band.

Pick a freq between 108 and 118 - they are used for navigation and
Instrument Landing Systems.

Now slowly tune a portable receiver between 97.3 and 107.3
Somewhere in this range (10.7 below the scanner freq) you will hear the
LO of your portable.

So there you are with a little radio up close to the window transmitting
a very weak signal on the frequency your pilot may be relying on to find
the runway in miserable weather. Depending on where you are seated you
might even be able to see the aircraft antenna.

That's what happened during the Superbowl.
My little Sony portable completely obliterates local navigation signals.

Not sure what military gear you are familiar with but the US military is
in the process of a major upgrade to their ILS receivers to meet
European interference standards. I would assume (makes an ass of 'u' and
'me') that most professional civil avionics meet European standards
since many of the aircraft at one time or another find themselves in
European airspace.

And, of course, avionics uses frequencies throughout most of the
spectrum. Certainly from 100 kHz up through a few GHz depending on the
aircraft.

I too operate a laptop, a desktop, a 50W 2M/70cm rig and a 100W HF rig
with no problems. But I have completely disrupted an ATC radar display
by operating a 2m HT in the room.

Horse shit!!!!!

Your little HT becomes a low level transmitter as soon
as it's turned on (because of internal injection frequencies).

It is within a few yards of very sensitive receivers
looking for navigation signals, often feeding "fly by
wire" flight assistance equipment.

Pull the batteries, put it in checked luggage, and pick
it up at baggage claim at your destination. Have a nice
flight.

With all kind wishes,

de Hans, K0HB

I dunno, Chris. I started this thread 1/2 for some questions I had and
1/2 for simple discussion to see what we'd come up with (my .02 thrown back
into the gene pool). I've seen several very good reasons that seem to be
very reasonable. Everything from emergency comms to harmonic generation for
testing to driving transverters to actually gaining full use of the legal
band limits. Of course, I've seen some that I don't think would pass muster
under closer scrutiny, though I appreciate opposing views.
One thing that occurred to me today was the term "type acceptance" and
what part 97 says about homebrewing and alteration.
Somebody give me a sanity check with part 97 in hardcopy here:
It's fairly clear with regard to amplifier, okay? But, "type acceptance"
is an obsolete term (historically) isn't it? I see constant mentions of,
"formerly known as type acceptance" and was originally intended for the
initial manufacture of the equipment. I guess what I'm saying is that it
seems legal to modify your equipment to do things it wasn't originally
manufactured for (with specific exceptions) so long as you're complying with
accepted operating practices. Does that sound correct?!

Simply tell them that it's a ham radio and if questioned further, tell them that you are a Federally licensed ham radio operator. Have a copy of your license available. You won't have any trouble whatsoever.

This is an interesting discussion. Most of you mention emergencies and that
is fine. One other reason to, "open up the radio" that is not an emergency
is if you travel on logging roads. Most are 1 lane and the drivers have a
system of calling on-coming traffic to use the turnouts. The drivers like to
know the location of all traffic on the road. You just have to give a
description of your vehicle, location and up or down bound. In my location
the companies encourage this by even posting the frequency used on that
road.

I don't know about the rules in the US, but here is South Africa it's legal
to operate on an airliner with the captain's permission - actually getting
that permission is another matter entirely! I know a few hams who are also
private pilots that have in fact installed quite extensive rigs in their own
planes. Over here the aircraft owner/captain has full authority.

Yep, they did away with type acceptance. Now the stuff is "certified".
Which means you are in their database. Sure, it's totally legal to do
anything to your radios. No problems at all. But many that I hear
using ham rigs for other bands are skating on very thin ice. There is
no question that it's illegal. Don't take my word for it, ask Riley.
Sure, the use of any radio freq in an emergency is legal is that is
all you have. BUT!!! that must be the last resort. If you have a phone
booth 2 blocks away, but are too lazy to go to it and use a phone,
then it's quite likely you could catch some flack for using a ham rig
on a police band. Here in Houston, getting on the police freq's is a
surefire way to go to jail fast. You better have a real good reason
for it. Like being stuck out on the freeway with a car laying on you.
You must have no other option available for it to be legal. And it has
to be a real life or death emergency also. I have my dual band HT set
by keypad entry to receive a wider freq coverage. But it won't
transmit out of band. None of my newer HF rigs are unlocked. My newest
706g is still stock. And I'm going to keep it that way. Why? Because I
listen to police on it quite a bit and I don't want to have a
"mistake" like me sitting on the mike or something. If it just
happened to have the right PL on, which BTW is the same as a rptr I
commonly use has, well....Trouble... Also , if I ever had any FCC
enquiries, I can key the rig on any band I'm not legal on and it will

do nothing. Keeps me safe in case of mistakes. Of course, it's totally legal for me to open it up if I wanted to. But I better not use it out of band in that very rare case of emergency. So rare, it may never happen. It would have to be something really way out there for me to talk on a police band. Or any other I'm not legal on for that matter.
MK

I heard you talking to K1KW on 10m AM the other day. You both had good signals.
I don't know what Chuck was running but he had great audio. Through my wide filter on the 706 he sounded like an AM broadcast station. Must have been an old collins or sumthin with a good mike... MK

> Bob
> N7ND

Dunno. I don't think that exact relay is made anymore. Neither is the
main big one. "not sure which one you mean" I tried with the original
maker even one time and no go. They didn't stock it any more. You may
have to retrofit something, or find a junker radio and get the part
that way. They did still make ones sorta the same, but always one
thing or another wrong, such as too tall, too wide, wrong mounts, etc.
Real pain...I finally gave up after them looking through their
warehouse for two hours. MK

7683. ANTENNA MADE FOR AO-40!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-21 08:32:12 UTC
From: Glenn Rollins <glenn@n3iyr.com>
Message-ID: <frs52uspq6u7t8je7kg1asb14q6v6slp6i@4ax.com>
Source record: 50287

I am now accepting orders. Overseas shipment is confirmed. 20 3' antenna and feeds to arrive in about 14 days. 10 taken.
I have worked very hard to bring these antennas into the country after they were made to my design. These antenna are NOT BBQ grills posing as microwave antenna. These are the real thing. I'm not a big company, i'm just a Ham like you trying to fill a void out there. I was amazed that there wasn't a single company making anything of real quality for AO-40, so I thought I would give it a try. I hope I am not offending anyone by posting here. I'm just trying to get the word out and save possible customers the cost of advertising.

Drop by my new web site and look around. Leave me a comment if you like.

Hi Jim,
You're right that the human factor permeates HAM. We'll never isolate that one:) But, as a community, we're a family that takes care of our own. The regular Ping of fact & opinion that are inappropriate or illegal is normally met with the corresponding Pong of correction and explanation why. It's a healthy thing that we'll never completely do away with because of the inevitability of human error. How well we police ourselves shows the casual observer how close OR dysfunctional a family we are.
One minor correction though, I'd say that the point of Ham radio is Communication. Occasionally, it's disappointing to see bitter swipes between two guys because of misunderstanding. But, they usually get through it okay.
I tried the CB route many years ago and was promptly out of it. The very first time my wife tried a radio check, she was insulted with profanity and racial slurs because of her accent. Then, when I tried to "clean up the band" I was almost provoked to a fist fight! Not the kind of group I want to be associated to:(
73's and Good Luck On Your Test,
Drink, WP3JQ
P.S. Use caution cross-posting to so many NG's. Some are better than others:)

Harold.....

I don't own an Alinco 610, but have remote mounted a Kenwood 733 in my wife's Cherokee. I bolted the RF deck to the rear wall near the hatch and ran the remote cable/head to the front. The head fits rather nicely on the end of the center console, just below the dash. The hard part is having to snake the power lead through the firewall to the battery, but thats the case with most installs.

I would have to assume that RF deck and head of the 610 are about the same size as the 733? Should work just fine.

I agree with Drink 100% on this. The only gear I have
that is 'opened up' is my IC-820H as I wanted the 420-
430 MHz segment for CW. I have friends who do the
mods for the 'In case I want it' or 'Because I can do the
mod', both of which I fail to understand. I have too much
fun just hamming to do all the 'expansion' mods.

A great holiday season to all and may our DX be good
in 2002!! 73 de Carl - K0BZV

Drink,

Thanks for the reply, it makes me feel better about a group I am about to become a member.
I'm a little nervous about the test, gee, I'm 45 years old and back to studying and taking tests!!

But I've passed about 10, or so, sample tests so I guess I'm ready. January 17th is the day things change for me now.

I have a 95 cherokee with an IC706 in it. I use the separation cable and have the head mounted on the console in front and the radio mounted under the rear seat on the driver's side. I also have a two meter amplifier mounted there.

At first I was worried about things getting too hot, but that has not been a problem. There is probably room under the front seat for the radio also. I have been thinking about changing as it would make it easier to remove the rig when I need it elsewhere.

If you have the premium sound set up in the jeep, the space under the rear seat may already be used. The passenger side has the jack, but it might be possible to put the radio in there, too.

I used to be the same way and never checked the tire in the trunk for air or bothered to carry any tools along as I was too busy driving around.

It makes no sense to manufacture something that does several things, then make a circuit that prohibits some of the things from working. The fact that you don't see anything illogical about THAT, but instead about people who FIX the item so it works again as manufactured, then something is wrong.

Cidco used to make 3 caller id boxes. a 10 number memory, 30 number, and 99 number. They were all the same on the inside, and purchasing a 10 number memory and moving the solder bridge jumper inside would get you the 30 or 99 number memory. I suppose you would not understand why someone would perform that mod as well. You might actually think it makes sense to manufacture something that can store 99 numbers, then put a jumper in it that restricts it's memory to only 10 numbers.

Bel radar detectors used to come the same way, open up the cheaper one with no led bar graph signal strength meter, add the missing leds to the circuit board, and it again works as designed to work.

There is nothing wrong or weird with FIXING things, it is leaving them in their restricted modes that is weird or bizarre.

Excuse me while I now go remove a wire from my refrigerator so that the freezer portion does not operate. If anyone does a mod to fix it, I will ask them "WHY BOTHER?"

Well, I think we're starting to compare apples and oranges a little, but, I still see your point. In case my original question has distorted through discussion, I'll rephrase: what are the pros/cons of mods? Actually, Leland I think it was, rephrased, "Why NOT mod?" Though it's meant more to make me reconsider than to answer with specifics, it kind of sums up what I'm thinking after watching the thread progress.
I wasn't for or against initially. And, some still aren't really good ideas. But, besides the two worst case scenarios (damaging equipment in the mod or my three year old evil genius telling the police dispatcher that now SHE's WP3JQ!:) modifying my equipment to it's full capacity has a new, favorable light. I don't plan on doing any mods, though, since I still have no pressing Need to it.
73 and a Very Merry Xmas to You All,
Drink, WP3JQ

That's an even better way to look at it, as there are lots of pros, but not one single CON!

> But, besides the two worst case scenarios (damaging equipment in the
> mod

That is not a valid point, as anyone who does not know what they are doing should not open up the unit to begin with. By this silly logic, anyone could say that there is a CON to fixing a radio with a loose power connection, because someone could permanently damage something while attempting the repair! Fixing something is never a con, and returning a radio to operate as it was designed and is capable of operating is fixing the radio from it's handicapped state.

> or my three year old evil genius telling the police dispatcher that now
> SHE's WP3JQ!:)

This is idiotic behavior, and has nothing to do with modifying the radio. The same person could use an unmodified radio and swear obscenities and bomb threats on frequencies available before the mods!

> modifying my equipment to it's full capacity has a new,
> favorable light. I don't plan on doing any mods, though, since I still have
> no pressing Need to it.

I still have never had any need for my spare tire in the car either, but I still modify the spare so it continues to have enough air pressure.

Yeah, I guess I'm not having that hard a time with it. The electronics is
really no problem, Navy saw to that, it's the frequencies/bands/priviledges
that are really giving me trouble. But I've been able to guess my way
through at least a couple of right answers on the the sample tests.

It's just when I get in the room, and have pencil in hand, something goes
whacky in my brain, and I'll forget my middle name if it was on a multiple
choice question...

You need to desolder the mic and speaker PCB tabs. The speaker and mic
remain firmly attached to the front part of the case.

7712. 2wayradioauction.com

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-22 02:30:27 UTC
From: Kamatu <admin@ahww.net>
Message-ID: <a00sd10tej@enews2.newsguy.com>
Source record: 50219

Well, folks, I have been pleased with my overall experience with 2wayradioauction.com as far as 99 percent of the folks there are concerned. The administrators of the site are very helpful. The buyers and sellers are, for the most part, pleasant.

But, there is one seller in particular everyone should avoid at all costs.

His name is Terry Wilson and he sells under the username 72632.

He has up for auction a YAESU 767GX,LIKE NEW Item #1009171781 with the following description:

"I HAVE (5)767GX,MOST COMES WITH MATCHING SPEAKERS&MD-1 MIC,ALL HAVE BEEN SENT TO YAESU&CHECK OUT&REPAIRED IF NEEDED.PRICE,S START AT 600.00&DOWN.SOME HAVE THE 2/6/440 MOD. INSTALLED.EMAIL kc5vcr@arkansas.net 4 more info. THANKS "

I was confused by this description because Terry Wilson says he has 5, but the auction is for 1. He said prices start at 600 and down, but there is a reserve price on the auction. He said some have the MODS, but he is only auctioning one.

I was concerned enough about asking questions that I sent him the following email:

"I'm confused by the description. What exactly are we bidding on?"

His answer was:

"It has been sold"

And yet, the auction is still active and he is still taking bids.

When I suggested he take it off the auction, he wrote me back the following email (and I quote):

"F... YOU"

Hmmmmm...

Really mature.

Avoid Terry Wilsons auctions at all costs. Some have said he has contacted them outside the auction trying to sell units for a price other than the winning price. And other horror stories.

Thank you for your time.

I know what you mean. The technical parts are logical, and if you know
the basic theory, you can deduce the answers. The legalities are not
always logical, so you need to memorize those parts.

The sample tests usually use the same question pool that is used on
the actual test, so if you learn the style and get comfortable taking
sample tests, you should do as well at the real exam.

Well, great, since my car is capable of running over and maiming people, I'll be sure to modify it's behavior next time I drive, and run a few folks over.

I think you're missing the point of why some equipment is restricted in its capabilities.

I also think it would be impossible to explain that to you.

Have a good day,

Bob

Hi All;
I have for Sale an Icom IC-2KL solid state amplifier with matching Icom Powewr supply.
Covers 160 to 12 meters, tested 500 watts output on CW, only needs about 30 watts depending on the band.
Can automatically interface with a few Icom rigs like the IC-720 thru IC-745.
If not, it will work with any rig that has a normally open relay that shorts during xmit. This will key the amp in xmit mode.
All in Very nice condition.
Price is $1299.99 plus shipping!
Thanks es 73.....RICH-WA2RQY RLUCCH2098@aol.com

Hi

I'm getting ready to move across the country, and thought I'd lighten up (no pun intended) a bit.

I have a couple things I'd like to sell:

1.) A signal generator/radio alignment (vacuum-tube). - Signal Corps model 1021 SCRL 43.
I checked it a couple years ago. It has two bands with a cavity switch. I was able to see a signal on the lower band, which was in the megahertz range, but the upper band was too high for my scope, I think. I can't be certain if the upper range works.
It has 600 hz and 8200 hz modulation.
It's built like a tank, with oil caps.
I'm offering it as-is

$20 takes it, with local pickup preferred in the Wash DC area. I can ship it, but that would probably cost more than the gear.

2.) A Roberts 1670 vacuum-tube reel to reel deck. It's stereo, with built in hi-fi speakers. I used the amplifier/speaker part of this for a year without any problems in my shop. the reels move, but I've never tried playing anything on it.
It's being offered as-is.

$40 takes it, local pickup preferred in the Wash DC area.
Shipping would be a difficult thing to do, but I will consider it if you're interested. (it's about 3 feet long.)
Bob H.

My email is:
b.hedbergX@verizon.net (remove X for real email
Bob H.

Just grab that plate in one hand, the chassis in the other,
and FEEL the power of tube audio!!!
(not literally, of course, just kidding. DON'T DO THAT!)

7720. Mods for the Titan 10 meter rig.

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-22 13:50:15 UTC
From: Ralph Mowery <rmowery@dialpoint.net>
Message-ID: <3C248F97.535B864F@dialpoint.net>
Source record: 50224

I am looking for a 10 meter rig that I want to use with a 10 to 220 mhz transverter and I want a broad range of frequencies.
Was looking at the RAdio Shack modle and saw the following rig below. Are there any mods (looked at QRZ and a few other places) for the Titan ? Also think the Radio Shack htx-10 will do the multimodes but saw a post that said it would not mod to a wider frequency.

Any other thoughts on a rig that will do all modes and cover several mhz ?

==========

From <sfritts@bellsouth.net>:
".....and go out and get yourself a multimode such as the Titan 10m
mobile. They can be had for $99 from....."

The Titan all modes are currently going for between $75-85 Brand New on
Ebay, many auctions....see for example:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1312478921

just got back from round trip to SF. what a nightmare. the security
line stretched the entire length of the terminal into the next
terminal.

carrying an HT won't really make a difference. they're randomly
selecting folks for full baggage search (i got flagged 3/4 times going
to airports...that's enough reason for me to want OBL greased)....

just be prepared to turn the rig on.

and if you're going to a big airport (EWR, SFO, SJC, ORD, etc), be
prepared to wait for hours...

It's got to be inside the PRO. Either the jack switch is not working
or is shorted (perhaps a solder bridge across the PC board runs).

They did not make too many of these, probably less than 350 of them. Looks like a Triton 4, but says Triton II. 80-10, in good shape. Needs a tweak here and there probably but does work.
Front is clean, some letters missing, as they easily wear off. The panel shows no sign of wear though....Comes with manual, CW filter (option) and I will ship to you for $175. I have three of these and don't need four.
Frank Krozel

Message-ID: <7O2V7.47667$x25.4651136@news20.bellglobal.com>
Source record: 50150

I am thinking about removing my 10m rig and installing an FT900 in the car. Should I be concerned about condensation in the radio? The nights up here are pretty cold right now, and I had concerns about the radio once the interior of the car warms up with condensation forming on the circuit boards etc. I'd like to hear from ops running similar rigs with any problems they've encountered. 10m is only going to be open so long!

Thanks,

Max ve3tmt@rac.ca

> ~Feline Tech.

I WAS answering his question. But for those unable to use 100% of their
brain I will translate...

The HTX100 is unmodifiable. There were rumours when it first cam on the
market that you could modify it similar to the HR2510/2600 series radios but
you can't. It was also suggested that by replacing the microprocessor chip
with the one from the HR2510 it would work. FALSE! So if you want to
spend all that time and money be my guest, but as I said in my original
reply...

IT WOULD BE CHEAPER JUST TO GO OUT AND REPLACE THE ENTIRE RADIO. FOR
$85-$100 YOU CAN'T GO WRONG!

Merry XMAS to all (well most of you)

I would be interested in how the SEA235's "ham radio operating system" works. I suspect it has some real ham applications like for digital modes and for pre-programmed net frequencies and mobile use or even remote control, but it sure would be nice to have a VFO for casual operating.

You probably need (a) tuner for mobile/maritime use because you will need to match the antenna for frequency changes, unless you have lots of real estate for separate tuned antennas or a sophisticated multiband antenna system.

Certainly the case can be made that some Amateur radio models are clean enough for maritime and commercial use but FCC requires that channel programming not be easily accessible to the operator (some actually switch the VFO knob with a channel knob and get a different sticker) but most have certain ranges where spurious emissions are excessive for FCC certification, and the requirement for channel accuracy is real. MARS, CAP and other federal uses are outside of FCC jurisdiction, but this opens the door to still more technical (rather than legal) and operational issues that must be must be dealt with so they don't hamper communications.

Jim, ac6tk

"Gary P. Fiber" <g.fiber@verizon.net> wrote in message news:4ru42u4nmd978j2g9kvafj7f77ksbjv8lb@4ax.com...
: Others say that they are as
: >precise as the marine radios, but the manufacturers just don't bother
: >to have them certified.
: >Ken
: >(to reply via email
: >remove "zz" from address)
:
: The Marine SSB transceiver for sale in and to be licensed within the
: United States must meet the technical requirements of FCC Part 80 to
: end rules.
:
: One part of the technical requirements is the transceiver must be
: accurate to within 20 Hz, no amateur transceiver is that accurate with
: out some sort of crystal oven. Also the Marine transceiver is not
: allowed VFO control but is channelized. Where the Amateur transceiver
: is allowed VFO control. There are also spectral purity considerations
: the Marine SSB transceiver must pass.
:
: The Amateur transmitter is NOT tested by the FCC or a testing lab for

: spectral purity, only the manufacturer must test and make sure the
: amateur transmitter meets FCC Part 97 technical requirements to sell
: the Amateur transmitter with in the United States. The Amateur
: manufacturer who builds HF only transceivers follows the same rules
: you would if you home brewed your transceiver, only the manufacturer
: does notify the FCC how many transceivers are imported monthly.
:
: Amateur Transceivers with Scanning receivers that scan two or more
: frequencies an operate above 30 MHz get caught by FCC Part 15 rules
: for Scanning receivers. These products only the receiver is tested for
: spectral emission's again the transmitter is NOT tested by the FCC or
: a testing lab. Amateur transceivers in this category are Granted
: Equipment Authorization. here you will see the receiver range the
: manufacturer asked for Certification on.
:
: For example for the IC-706 MK2G the receiver is certified to operate
: from 30 - 200 MHz and 400 - 470 MHz . Any opening of the receiver
: beyond this range violates the Grant of Equipment Certification, the
: manufacturer can't sell an IC-706MK2G with a wider receiver range
: unless they resubmit it for another FCC test and a new Grant of
: Equipment Authorization. The FCC then would have to check the test
: results and Grant another Certification. It does get involved and
: costly.
:
: What it means to the amateur operator who opens his receiver and the
: receiver radiates causing neighbor's TV etc interference I don't know.
: As once you open the receiver it no longer meets the FCC Part 15
: Certification the transceiver was sold under. I suspect the Amateur
: would then assume responsibility for the receiver and it's radiation.
:
: Amateur HF amplifiers are the only amateur radio product that is Type
: Accepted. This is to certify the HF amplifier does not amplify
: transmitted signals form 24 to 28 MHz from the manufacturer.
:

I've run a bunch of different mobile rigs in the car over the years and never had a condensation problem that I know of. That includes New England to Florida. I have had a problem with the squelch on the Vhf/Uhf stuff running open until it is either re-adjusted or the vehicle warms up. No big deal on the older rigs, you just reset the squelch know. The newer rigs require you to go into a menu to change the squelch so I just turn the volume down until it warms up.

7753. Re: HTX 100 MOD needed

So you are saying that the mods listed for this rig such as the one at QRZ.com are wrong ? There is a mention that the HTX 10 is not modifiable but not the HTX 100. It is one thing to clip a wire or two but I am not about to even think about changing the microprocessor as it would drive the cost way up.

I have no idea on what will work or not, but I am looking around for a cheap 10 meter rig to use with a 220 mhz transverter and want one with some wide coverage so that I can get the whole band on 220. The 5 to 10 watt output is fine. I was pointed to a mod for the Titan and it seems that it is made under about a dozen names (nothing new to me). Maybe this is the beter rig to use ?

Source record: 50162

I'm thinking of buying a Yaesu FT1500M 2 meter rig. I'll use it in my sailboat as well as the car. I've seen mods for a lot of 2M rigs to TX on a wider range of frequencies than just 144-148. beinga bale to modifiy the 1500 to work in the marinve VHF band (around 155-165 mHz) would make it a great backup for my regular (but rather old) marine VHF in the event of an emergency.

There is a mod on QRZ.COM for this rig for MARS/CAP frequencies, but I don't know if this will also cover the marine band.

Anyone know if this rig is modifiable for marine band use?

Thanks

My HTX-100 which I hadn't used for years was found to have low transmit
gain.
Now I have to shout to get 10 W PEP. I am aware of mod at qrz.com to
increase
the gain, but would like to identify the bad component.

Did anyone experience this problem, and what caused it?

Could someone with a service manual provide me with the proper AC levels
at the different stages in the transmit chain?

Thanks,
Erik, K7TV

7760. Why is the Cliffdweller II antenna "stinky"?

I am just starting out and antennas are a mystery to me. I am looking for a compact antenna that doesn't give up too much performance.

I saw the slinky Cliffdweller antenna described as "stinky" in a posting (undisputed) to this n/g I found on Deja.com.

How stinky is it? Is it half as good as a Superloop 80? A tenth as good? No better than a coat hanger?

Is it equally poor on receive and transmit?

To a beginner, it seems that If you stretch it all the way out and put it 36 ft. in the air, it should be satisfactory. How much does it lose as it coils up?

Its a BIG compramise antenna. Much better off with a traditional dipole or loaded dipole. Do some reading up on antenna there is allot of info on the web you people need to do some hunting of information and stop taking adverts word for it and other word for products. In other words do your homework.

Hello,

My Amateur Radio Club has purchased a TxID-1 unit.

However we are having trouble when we run the "TX"
software. It loads up, however it indicates that no TxID-1
card is found.

We have checked and double checked the manual and
followed the recommended procedures, without any luck.

Has anyone experienced this problem before?

Any help is greatly appreciated.

Thanks,

The way the FCC states it, "We are able to use any means necessary for safety of life or protection of property."

Now, if you happen across a injured person and your not able to raise a repeater with an autopatch or a ham to relay, yes by all means get on the frequency and explain that you need help. We are "classified" as Public Safety Officials by most states/commonwealths/provincial governments. You will be asked why you did what you did, simply state what the situation was. The Fire/EMS/Police will not fry someone for saving a life, they just need to document it correctly in their reports. Sound professional and you'll have no problems

However, if you had a cellphone with you, you would have big problems.

I have many times been traveling and seen a drunk driver, etc and called it in. Informing the dispatcher that I have the ability to talk direct

with the officer/trooper, they make the first call to me then the onus is off from me.

My big concern is that if it's stolen, who ever took it knew what they were after. So, I suggest never leave your HT in the car or truck.

Make sure you keep the floor mats dry. Leakage, wet carpets and
insulation are the worst offenders. Beware of mounting screws that
go through the floor or outside surfaces. I once had re-occurring problems
with an intrusion alarm that was mounted inside on the firewall.

Bear in mind that the coldest surfaces in the car will get all the
condensation. I don't know how well sealed the ft900 is, but you
shouldn't have a problem if you have a well sealed car.

Jim.

AMATEUR RADIO NEWSLINE(tm) REPORT #1271 - DEC 21, 2001

Amateur Radio Newsline report number 1271 with a release date of Friday, December 21st, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T. A national ham radio society is asked to train new hams for government service. This story is first on this weeks Amateur Radio Newsline report number 1271 coming your way right now.

(Billboard Cart Here)

**

THE EDUCATION SCENE: HAM TRAINING LEADS TO SA GOVERNMENT JOBS

A government agency has asked a national ham radio society to help train new hams. The reason. careers with that agency. Its happened in South Africa as we hear from Q-News Graham Kemp, VK4BB:

--

In South Africa, their Department of Communications contacted the SARL with the request to train seventeen post graduate students as amateur radio operators. These students had already qualified in different fields, some technical and some in the Information Technology fields. There were nine ladies and eight men. From next year they will be employed by the Department of Communications, and the idea was to give them some experience in the field of radio communications.

Training was done by Henry Chamberlain, ZS1AAZ, over a period of one full month. In addition to lectures, the students could see practical demonstrations of amateur radio and they spent one period building and testing a Morse Code practice oscillator. They also visited ZS1AAZ's home shack. The seventeen students had already proved their ability by passing their previous studies successfully. It was therefore no surprise that they ALL passed the amateur examination.

For the Amateur Radio Newsline, I’m Graham Kemp. VK4BB, of Q-News.

--

The seventeen will be assigned specific jobs with the South African Department of Communications in early 2002. (SARL, Q-News)

**

SPECTRUM SHARING: FCC SAYS YES TO HIGHER POWER UNLICENSED TRANSMITTERS AT 2.4 GHZ

The FCC has approved issued new rules permitting certain unlicensed Part 15 devices operating between 2405 and 2450 MHz to use higher power, but under significant restrictions. The band is allocated to amateurs on a co-secondary basis. Amateur Radio Newsline's Norm Seeley, KI7UP, takes a look at the FCC action:

--
According to the C-Q Magazine website, the decision was adopted on December 11Th. In it, the FCC approved a petition by Sierra Digital Communications, Inc. to permit unlicensed fixed point-to-point transmitters in the band to operate at field strengths of up to 2500 millivolts per meter. This is a tenfold increase over past power limitations.

Sierra Digital Communications manufactures and sells equipment for wireless data communications, including high-speed wireless computer networks and Internet links. The ARRL had opposed Sierra's petition on the basis of increased risk of interference to amateur and amateur satellite operations. This is because the downlink from the AO-40 satellite is in the 24 GHz band.

But the FCC said it believed the restrictions it is imposing on the higher-power transmitters will provide sufficient protection to other users. This includes industrial/scientific/medical equipment, radar and Earth exploration satellites, in addition to amateur radio. The new rules require highly directional antennas and high frequency stability of transmitters.

For the Amateur Radio Newsline, I'm Norm Seeley, KI7UP.

--

In its decision, the FCC singled out an ARRL comment where the League clamed that Part 15 devices are permitted by the Communications Act of 1934 only where they have no interference potential to licensed services. The Commission called the League's interpretation of the law overly conservative. It said that its rulings to date appropriately provide a means for allowing unlicensed devices to share spectrum with licensed services with little risk of interference and adequate protection to licensed service. (CQ)

**

HAM RADIO AND THE WAR: MARS ON THE AIR FROM THE WAR ON TERROR

Ham radio is making it possible for those fighting the war against terrorism to phone home. This as the ARRL Letter announces that Army Special Forces on duty in Islamabad, Pakistan, and in other undisclosed locations have begun keeping in touch with home via MARS -- the Military Affiliate Radio System.

Phone patches provided by the Military Affiliate Radio System make it possible for troops to call their families in the US from areas where commercial communications channels are not available. Amateur Radio operators enrolled in MARS provide the connection between the Military Affiliate Radio System stations deployed overseas and the telephone system back home.

During the Vietnam War, phone patches were a major source of comfort to families and service members alike. MARS also responded during Operation Desert Storm. (ARRL)

**

BREAK 1

Wishing you a Happy Holiday from the United States of America, we are the Amateur Radio Newsline, heard on bulletin stations around the world, including the Great South Bay Amateur Radio Club repeater, W2GSB, serving West Babylon New York.

(5 Sec Pause Here)

**

HAM RADIO AND THE WAR: GODDARD ARC FEELS THE PINCH

The Goddard Amateur Radio Club says that it has been having serious problems with manpower lately and the war on terrorism is partly to blame. This is because new security restrictions imposed after September 11th require all visitors to Goddard to be escorted by a badged employee at all times.

According to Dan Schultz, N8FGV writing to the Amsat Bulletin Board, the clubs WA3NAN ham shack is located on government property we are bound by the new restrictions. This says Schultz makes it much harder to bring in control operators who are not Goddard employees. As a result, WA3NAN which for years has been the primary rebroadcaster of shuttle communications on the ham bands is not there as often as it would like to be.

Schultz also notes that the Goddard Amateur Radio Club currently has no president because no one has stepped forward to accept the job. The position of Shuttle Retransmission Director is also vacant, this is the person who makes the phone calls to get operators lined up to pull shifts at the retransmission facility.

Schultz says that the long term technical solution will be to automate the station with remote controls and telemetry for the transmitters so that the retransmission operator can operate from his home. But adds N8FGV, but that is still a little ways off in the future. As a result, WA3NAN is not there as much as it used to be. (AMSAT-BB)

**

AMERICA AT WAR: NEW HOMELAND TERRORIST ALERT SYSTEM PROPOSED

Homeland security chief Tom Ridge is considering a multistage system for terrorism alerts. Ridge is also weighing how to reimburse states for the costs of increased security since the terror attacks.

Since the September 11th terrorist attacks on New York and Washington, Ridge has issued three general warnings. None of the alerts identified specific targets.

Now, according to news reports, Ridge will propose a four-stage Threat Alert Network similar to the military's DEFCON'' system. DEFCON alerts military personnel to the seriousness of a threat. A private sector version would be aimed at helping state and local law enforcement personnel determine the level to react to a Federal government issued terror warning.

The proposal came to light after California Governor Gray Davis met with Ridge about a week and a half ago. Davis told Ridge he had proposed such a similar system for California, and said Ridge had asked him to wait pending a national model. Ridge told Davis that he hopes to unveil the national system by January 15th of 2002. Whether or not ham radio will play any part in such an alert system is not known as we go to air. (Published news reports)

**

AMERICA AT WAR: CONFERENCE HELD ON ALERTING THE PUBLIC

Still in there area of alerting the public, more than 120 leaders from the emergency warning community met November 30th and unanimously called for the creation of a public-private partnership. This, aimed at improving the delivery of timely and accurate emergency information to people at risk. Don Wilbanks, KC5MFA reports:

--

The group came together at a special conference arranged by the National Warning Organizing Committee. This is a group of emergency warning advocates representing the public and private sectors.

Those attending included federal, state and local government officials, not-for-profit organizations, and representatives from the private sector. And in the end the group has tasked itself to improve the delivery of warnings and emergency information to the public. This, through better education, research, standards creation and policy recommendations.

The Committee Chairman is David Liebersbach, Director of the Alaska Division of Emergency Services. He has appointed Peter Ward, formerly of the U.S. Geological Survey and chair of a White House-appointed working group on natural disaster information systems, to head up a committee to determine the new organization's structure and governance. Ward also serves as the new organization's spokesman. More news on the work of this committee as information is released.

For the Amateur Radio Newsline, Don Wilbanks, KC5MFA, in New Orleans.

--

The conference was hosted by The MITRE Corporation in McLean, Va. MITRE is a not-for-profit national technology resource that provides systems engineering, research and development, and information technology support to the government. (MITRE)

HAM RADIO AND EDUCATION: HAM RADIO MASS BALLOON LAUNCH

The Timberlane Regional High School, in Plaistow New Hampshire will be taking part in a high altitude experiment next spring. This with an announcement that the Coordinated Algebra II and Physics classes taught by Lorainne Mascioli, N1VYQ, and Lou Broad, N1RCA, are planning thier third year of ham radio and high altitude balloons in May of 2002.

Six student teams will attempt to launch their balloons at the Hosstraders Ham Fest at the Hopkington Fair Grounds in New Hampshire. Each team is responsible for design, construction, and operation of their system. Each balloon will carry a GPS receiver, a packet reporting system and several experimental payloads. This could include cameras, video, amateur television and cross band repeaters. At maximum altitude such systems will have a range of 300 miles and should easily cover all of New England and more.

The class has grown to 34 students and they are planning to launch six balloons in a two day period! This could make it a record breaking event in both ham radio and high altitude ballooning. For more information check out the CAPSAT Website located in cyberspace at
http://www.mv.com/ipusers/llb/capsat.html (Via Internet)

HAM RADIO SPOTLIGHTED IN POUGHKEEPSIE JOURNAL

New York’s Poughkeepsie Journal has highlighted ham radio in a December 6th front page article. The piece focused on the public service aspects ham radio with quotes and pictures.

According to Andrew Schmidt, N2FTR, who is an ARRL Assistant Director in the League’s Hudson Division, many Poughkeepsie area local hams spent time at Ground Zero or at the Red Cross centers in the greater NYC area following the September 12th terrorist attacks. Andrew says that their work is well highlighted in the article. The link is:
http://www.poughkeepsiejournal.com/thursday/community/stories/co120601s12.

A SPECIAL AM EVENT: THE HEAVY METAL RALLYE

This is Paul Courson WA3VJB with news of an operating event Saturday night, December 22nd. It's the Heavy Metal Rally, featuring big iron, vacuum tubes, and the warm and inviting sound of AM on the shortwave ham bands.

Starting around local sunset listen for rigs in the 250 watt or 250 pound category to populate AM gathering points on 160, 75 and 40 meters.

Jim, W8MAQ was testing HIS 1947 Collins 300-G a few days ahead of the Heavy Metal Rally. The retired broadcast transmitter re-tuned to 75 meters sounded like this:

In-Q: it's been great to get on... 300-G..
Out-Q: forward to that

--

Prizes include a trophy, pictured as a posting on QRZ.com, for the best sounding station.

Last year more than a hundred stations took part -- and the winner was Mike, WN3B, on a Gates 250-C. He gave Jim an audio report the other night:

--
In-Q: It's got more highs....
Out-Q: Shure 55
--

The Heavy Metal Rally is sponsored by Electric Radio, a magazine featuring vintage ham radio, and published by Barry N6CSW. The event was pioneered by Bill, KD0HG of Colorado, a broadcast engineer with a knack for big homebrew rigs that sound great.

Frequencies and a website are listed on the news page of QRZ.com.
Paul Courson, WA3VJB, Annapolis Maryland.

HAM RADIO HISTORY: COLLINS RADIO CENTER NOW OPEN

The new Collins Radio Center which is the headquarters for the Collins Radio Association is now officially open for guests and visitors. Located near Johnstown, Pennsylvania, the Collins Radio Center includes a representative collection of Collins radio equipment, from the 1930's to the present. There are other classic and antique radios on display as well. More information is on the web at www.collinsra.com. (Collins RA Press release)

**

HAM RADIO BUSINESS: CITY ELECTRONICS - RIP

Alex Stalinsky, WA5UHT, who owns City Electronics, a small parts outlet in Houston for almost 50 years, has decided to call it quits. According to Chris Boone, WB5ITT, this place was one of the main sources of parts, components in Houston long before the likes of Mouser and Digikey took off in mail order sales.

Chris tell Amateur Radio Newsline that he bought many parts from City Electronics in his early days of repeater building. In fact, Chris says his mother claimed that he owned half of the local Radio Shack but she was wrong. It was really like he was a part of City Electronics as were many other young Houston area hams and Chris tells Amateur Radio Newsline, it will be missed. (WB5ITT)

EMERGING TECHNOLOGY: INTELS NEW WARP SPEED CHIP

In another step toward faster computers, Intel Corp. has developed two new technologies that will help the tiny transistors inside microprocessors run cooler, use less power and operate more efficiently. The new designs

complement several recent breakthroughs in building minuscule transistors that form the basis of all modern computing as they switch on and off billions of times a second. Earlier this year, Intel unveiled transistors just 20 nanometers wide. Today's Pentium 4 has 42 million transistors, each about 180 nanometers. For reference, a manometer is about 10,000 times narrower than a human hair. (Intel)

**

EMERGING TECHNOLOGY: DTV ROLLOUT UPDATE

Roughly two-thirds of commercial television stations plan to broadcast a digital signal by a federal government deadline of May 1, 2002. This, according to the National Association of Broadcasters.

In a report to the Federal Communications Commission, the industry group said that many of those that won't make the deadline are waiting for equipment to be delivered and expect to have digital broadcasts on the air in the months afterward. But some stations in smaller markets are having a hard time paying for the upgrade, the association says.

Right now, most home television sets in use receive only analog signals. But congress has mandated that broadcasters must give up their analog channels to the government by 2006. As a result, there are concerns that consumers won't have made the costly upgrade to televisions that can receive digital signals by that date. (Broadcasting Daily)

HAM RADIO IN SPACE: EXPEDITION 4 CREW NOW ON THE ISS

An all ham crew is now in charge of the International Space Station and will be for the next six months.

Three astronauts and cosmonauts now running the ISS. They are Russian Commander Yuri Onufrienko, RK3DUO, along with American Flight Engineers Dan Bursch, KD5PNU, and Carl Walz, KC5TIE. They make up what is called the Expedition 4 crew and all three are expected to be on the air regularly for school contacts and possible open QSO times made available to talk with hams worldwide, as time permits.

The Expedition 3 crew comprised of United States Commander Frank Culbertson, KD5OPQ, along with Russian Flight Specialists Mikhal Tyurin and Vladimir Dezhurov is now back on good old Mother Earth. They returned on Monday, December the 17th aboard the space shuttle Endeavour. (AMSAT-NA, ARISS)

**

HAM RADIO IN SPACE: EDUCATIONAL ASSISTANCE FROM VK5ZAI

Attention educators. If you are thinking about teaching the International Space Station, here is a bit of assistance.

Tony Hutchison, VK5ZAI has updated his web pages with links to help schools in obtaining educational programs associated with the I-S-S and space science in

general. Hutchison says that this should be of interest students and teachers alike especially if they are contemplating applying for a ham radio contact with the astronauts on the station.

Hutchison is the Australian ARISS Coordinator. His website in cyberspace at www.electric-web.org (VK5ZAI)

**

SPACE AND SCIENCE: CHINA ON THE BRINK

Space Daily reports that China is getting ready to launch its third unmanned spaceship. This, to pave the way for sending that nations first astronaut into space sometime next year. China is reportedly also in final testing and preparation to launch a new satellite dedicated to study ocean colors and related phenomena. (Space Dailey)

**

DX

In DX, 9V1YC reports that he and eleven other hams will be activating South Georgia and South Sandwich Islands in January and February of 2002. The operation will be strictly on the high frequency bands. Exact dates, call signs and QSL managers are not being made public until the group is actually on the air. The New Zealand registered vessel "Braveheart" of ZL9CI fame will be supporting this team for the entire 30 day trip. (RSGB)

A bit higher in frequency, Jeff Klein, K1TEO reports that December 6th was another great D-X day on the 6 meter band. Jeff who lives in Connecticut says over the VHFReflector that the band was open for a solid two hours beginning at 7:30 am local. And talk about D-X. On his very first C-Q he landed HB9QQ who was operating portable HB0. Even better, Jeff says that the fifth caller was 4X1RF. (VHF Reflector)

Over in Great Britain hams are actually D-Xing for charity. Jeramy Boot G4NJH, reports from Nottingham in the U-K.

--

Every year in September, the British Wireless Fund for the Blind -- a registered charity - organises a fund-raising event in which amateur radio clubs and individuals are sponsored for the number and distance of the contacts that they make. As of the 11th of December, the British Wireless for the Blind Fund reported that 'Transmission 2001' had raised £6681.48, with more coming in every day. They say that they hope the final total will reach £7000. The charity offers prizes to the club and individual raising the greatest amounts.

This year the Cray Valley Radio Society operating as GB2FB and taking part for the first time, won the prizes for the club raising the most money and for making the most contacts. Robert Guscott, M5GUS, operating as GB0WB, won the prize for the leading individual.

Jeramy Boot, G4NJH.

--

The bottom line. This is another way that hams can not only enjoy their hobby, but can help others at the same time. (G4NJH)

**

THAT FINAL ITEM: A HAM RADIO CHRISTMAS STORY

And finally this week, the story that we wait all year to tell you. Its the ongoing story of hams who care about hospitalized children and what they do to bring a bit of holiday cheer to those kids who cannot make it to the mall to spend a few moments with old Saint Nick. Here’s Amateur Radio Newsline’s Joe Moell, K0OV:

--

As most hams know, propagation is very good this time of year. It's so good that it's easy to make contact with the North Pole. Many clubs around the country are taking advantage of these propagation conditions to set up QSOs with a very special North Pole station. They're making these contacts from hospitals and rehabilitation centers, and they sound like this:

--
Santa and Kids Audio Here
--

That's what the North Pole Network sounds like in southern California, where it's celebrating its 25th anniversary at Childrens Hospital of Orange County. In the past few days, I've heard from other clubs in the North Pole Network, including the AkSarBen ARC in Omaha and the Southwest Missouri ARC in Springfield. And YOUR club could bring holiday joy to hospital patients. There's a how-to article on the subject, with a dozen suggestions for your best North Pole Network ever, currently running on ARRL's Web site. That's arrl.org, of course. And there's even more about North Pole Network in southern California, plus lots of photos showing a quarter century of holiday fun, at the Hospital Disaster Support Communications System Web site, www.hdscs.org. Check it out, and start planning for your own North Pole Network joy.

Nothing wrong with a Slinky antenna. If that is all you can put up then it's the best antenna for your situation. I have one I built in my attic and work 160-10M with it using a tuner. I've had several long distance contacts with it so for the amount of fuss it was a good decision.

BTW: A dipole loaded or not is considered a compromise antenna to many as well. A skywave or full Rhombic is not.

Yes by all means do a little reading on antenna but don't go too deep or you will get lost and lose perspective quickly. A good overall view of different antenna configurations and how they work is really all one needs. I have studied antennas to the nth degree in university and frankly it does take the fun out of it sometimes. Knowledge is wonderful but too much can be a handicap.

Main thing is to have fun learning and as long as it remains fun, you will not lose perspective.

I think you're making more of my comment than I said. Simply explaining
that you have a ham radio and a federally issued license to operate it is
nothing at all like showing your Federal Pilot's License and expecting to
ride in the flight deck.

Julian

==========
Very crudely, every time the overall length is halved you lose at least 6 dB
or 1 S-unit. Then there's the tuner losses which increase at the same rate.

That's a pretty weak signal when it's all closed up.

Reg

I have been staying out of this thread because it is a "can of worms."
However, after reading the statement from Jeff, W8JSA, I have to jump in and
put my "two cents" in.
I agree with James, WP3JQ, in that Jeff has my interest piqued and I
would like to see how he can back up his statement. I don't know how things
are in Virginia, but here in New York, you aren't going to get very far, by
jumping on police frequencies, except to go to court and be in a legal
battle of a lifetime. As Dan, W6DKN, stated, the police, if they even
respond to your transmission, will be putting all their effort into
identifying you, than to finding out the need of the situation. They take
it very seriously, when someone transmits on their frequencies.
I think the biggest thing that throws people off, is the section in the
FCC rules covering this...

"Subpart E--Providing Emergency Communications
Sec. 97.403 Safety of life and protection of property.
No provision of these rules prevents the use by an amateur
station
of any means of radiocommunication at its disposal to provide
essential
communication needs in connection with the immediate safety of
human
life and immediate protection of property when normal
communication
systems are not available."

Now, with a modified radio, according to this section, you could use all
the frequencies on your radio, however, we still have to find a section that
says that it is legal to have a radio modified to transmit out of the
amateur bands, MARS, CAP and on to public safety frequencies. I haven't
found anything anywhere that says that it is legal for an amateur to have
such a radio. In fact, going back to the age-old argument about
"type-acceptance," we may start to cover the subject. As we know, amateur
radio operators, don't have to have type-accepted equipment, but every other
service does. With this in mind, when we modify an amateur radio, we have
definitely removed the type-acceptance, which isn't a problem for amateur
service, but then it is not legal to transmit on public safety, business
band, FRS, GMRS, etc.
There is another section in the rules, that covers emergency
communications during a disaster...

"Subpart E--Providing Emergency Communications
Sec. 97.401 Operation during a disaster.
(a) When normal communication systems are overloaded,

damaged or
disrupted because a disaster has occurred, or is likely to
occur, in an
area where the amateur service is regulated by the FCC, an
amateur
station may make transmissions necessary to meet essential
communication
needs and facilitate relief actions.
(b) When normal communication systems are overloaded,
damaged or
disrupted because a natural disaster has occurred, or is likely
to
occur, in an area where the amateur service is not regulated by
the FCC,
a station assisting in meeting essential communication needs and
facilitating relief actions may do so only in accord with ITU
Resolution
No. 640 (Geneva, 1979). The 80 m, 75 m, 40 m, 30 m, 20 m, 17 m,
15 m, 12
m, and 2 m bands may be used for these purposes.
(c) When a disaster disrupts normal communication systems in
a
particular area, the FCC may declare a temporary state of
communication
emergency. The declaration will set forth any special conditions
and
special rules to be observed by stations during the
communication
emergency. A request for a declaration of a temporary state of
emergency should be directed to the EIC in the area concerned.
(d) A station in, or within 92.6 km of, Alaska may transmit
emissions J3E and R3E on the channel at 5.1675 Mhz for emergency
communications. The channel must be shared with stations
licensed in the
Alaska-private fixed service. The transmitter power must not
exceed 150 W."

Again, in this section, I don't see anything about transmitting onto
public safety frequencies or the use of a modified radio that can transmit
on those frequencies. I haven't been able to find a copy of ITU Resolution
No. 640 (Geneva, 1979), which made shed more light on this subject or it
might be just as ambiguous as these rules.
Like I said, just my "two cents." I would like to add, that yes, I do
have a modified radio, and yes, I do transmit on business frequencies, but
as long as I make legal transmissions on the frequencies, then I don't think
I am going to ever be investigated by the FCC as to whether my radio is
type-accepted for such transmissions.

In a car, this is normally not that big a problem as long as no water
leaks into the car to make the air very moist. I have seen this
problem when out camping, etc . Say if I have my radio on a picnic
table. You have the dew problem. I found a simple trick to get around
this problem. Leave the radio on all night and cover it with a towel.
:) I've never really had much of a problem inside my car. The cold can
do funny things to radios though. The knobs will get stiffer, and on
some of these new fangled radios like my 706, below a certain temp,
the screen can go goofy. I think below 14 degrees if I rememeber
right... I've had times when I traveled to cold country where I would
take the radio inside with me at night, just so I wouldn't have to
warm it up the next morning. You'll drift until it gets warmed up. or
at least my ic-730 used to be that way. I assume my 706 will too. :(

I like to hear what you know about tuner losses. From your post you seem to think it's significant when in fact it's not! 6db is very significant and incorrect! I suggest you actual construct an antenna and try it rather than post this nonsense!

Drink,
Please note that I said "classified". The FCC has given us quite a bit
of power but not a clear path in which to use it. I also said that if it
was found that you had a cellphone or a another ham that could relay for

you, you would have big problems. I was a Firefighter in Detroit and a couple of times we had hams come on to the frequency and tell us about a 1-50i (traffic accident with injuries). This was well before cellphones, some of you might remember the old mobile/car phones ;-). Citations were given alright, at City Hall with the Mayor and press. Times have changed and the chances that one could not reach another ham, not have access to the autopatch or not have a cellphone are quite slim. But, let me ask you. If you had the situation come up that you did not have access to the twisted pair and the person had life threating injuries, what would you do?

Uh oh. Though it's reassuring to me when folks agree with me, it always makes me REALLY nervous and I have to go back and double check what I actually said:) HIHI. Thanks for transcribing what the CFR actually says, Guy. I don't like starting with paraphrased interpretations. There is always going to be ambiguity and issues not covered. The thing that many do is take a legal approach that's meant to circumvent the rules. (Ex: xmit into a dummy load at LOS. RF leaks off the load but your "not xmitting on the air 'cause you're using the dummy") When the rules become vague or don't address a specific situation, we must look to the spirit and intent. A boss of mine taught me this (standardization & evaluation division): "When someone asks what's wrong with x,y,z, I put it in a different context to see if that decision circumvents the spirit & intent of the rules." Things like cell phone rcvr mods, cable TV descramblers and the like are a ways off but still on this path, right? (Thinks to himself, "Hmm... Free mobile Pay-per-View with an IC-2800H?" :)

Guy,

Subpart E--Providing Emergency Communications Sec. 97.403 Safety of life and protection of property.
No provision of these rules prevents the use by an amateur station of any means of radiocommunication at its disposal to provide essential communication needs in connection with the immediate safety of human life and immediate protection of property when normal communication systems are not available.

This says it all. The transmission must provide what the emergency is, where it is and what help is needed.

I will face the rath of court than let some die.

Somewhere here on the internet, I am sure there is information on the
HW-100.
I need some help with PTT relay going into transmit, etc.
Is there a site that anyone knows of that lists hints and kinks??

You obviously didn't read what was here. I quoted that same section.
It is the first quote and after that, I said that no where does it talk
about an amateur with a modified radio. That makes the whole thing a
different scenario.
Please re-read that section, then say something.

Subpart E--Providing Emergency Communications Sec. 97.403 Safety of
life and protection of property.
No provision of these rules prevents the use by an amateur
station of any means of radiocommunication at its disposal to provide
essential communication needs in connection with the immediate safety of
human life and immediate protection of property when normal
communication systems are not available.

I could be wrong, But I think the Words "any means of radiocommunication at its disposal"
would cover it?

Humm - I understood it. A dipole that is not "loaded" is one that is a full physical 1/2 wavelength long - no loading coils to make it physically shorter. It's a "compromise" when you compare it to a yagi or a rhombic.

Most hams live with a "compromise" antenna of one sort or another - with possibly the exception of those lucky enough to have a full sized 5 Ele monoband yagi for each band on a 150 foot tower :-) The only question for most of us is where we are willing to draw the line on the compromise.

This station is from the estate of K0YTL, who passed away about 10 years ago. Ed's station was operational at that time, and I have just stored it since then. I had intended to set it up, someday, but that day never came. But christmas did! So it's on ebay now, you can be the 2nd user of this vintage, winged emblem Collins station. The owner's manuals and related paperwork are included. Good luck, and happy bidding.

I cannot believe that you would admit to such a thing on a public internet
communications medium giving your name and call sign..

I don't necessarily agree with all of the laws or the alleged federal
authority to establish and enforce them over the rights of the sovereign
states, but at the same time some people have absolutely no respect for
established order and protocol..

Are you also one of those guys who weave in and out of traffic at 90 mhp and
ride the bumpers of those who get in your way until they pull over and allow
you to have your own way, only to be waiting at the next stop light two
blocks up the road?

I mean, it's okay if you don't get caught, right?

> I could be wrong, But I think the Words "any means of radiocommunication
> at its disposal" would cover it?

I don't see anything written here to authorise use of emergency frequencies,
and all the moreso if you have an amateur radio transceiver with potential
repeater phone patch communications as well as open access to scores of
others hams who are ready, willing and able to effect a 911 phone call at
the drop of a hat..

People don't seem to realise that first off, amateur transceivers haven't
got the type-accepted frequency tolerance which is required for commercial
communications, not to mention that you would have to know the PL access
code for each and every emergency frequency programmed in. This is not to
mention that half of the idiots who wanna play GI cop and impress everyone
in sight with their new toy don't know when and when or how to access an EM
frequency and identify themselves to a dispatcher or a LE unit which is not
expecting intruders to just jump in and act as if they belong there..

I don't know about the legal technicalities of modifying your own equipment
to transmit into the EM bands, but personally I don't believe that this is
the responsibility of an amateur radio operator, most of who do it simply
because "they can." I say that if you have EM authorisation use your issue
transceiver, and the rest of you leave it to the operators at 911.

Just my two cents worth..

20,000 Volt Variable Power Supply, Spellman - Ebay

This magnificent power supply is variable 0 - 20,000 volts. It has a meter for voltage and a meter for current (leakage); see the close-up picture below. It can be used to perform hi-pot tests, and to verify insulators and dielectric materials. I purchased it to help in the design of a high power RF amplifier.

It works perfectly. As you can see, it is a rack mount design. The top and bottom are covered with sheet metal, so it can be placed directly on your workbench as well. The front panel and meters are in excellent condition.

I've been told that these sell for about $2000 when new, but I don't know if that's accurate. I purchased it a few years ago at the Dayton Hamvention.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1679201652

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

There are many options for small sapce antennas that work well. Loops are great when constructed properly. I have built a few and have had excellent results. There is allot of info on loops on the net. In fact I built my own tuning cap for one of mine so cost can be real low. In any event try lots of designs and decide for yourself what works for you. Don't pay much attention to those who trash every idea because when it come right down to it they are commenting from their armchair and really have no credibility.

I mearly meant a dipole with coils to reduce its length is considered a compromise antenna by some in comparison to putting up one that does not use loading coils (correct length). In fact anytime you need a tuner to tune an antenna for another band is a compromise antenna. But being a compromise antenna does not imply that it will not perform well.

Then kindly look here and you will see.
http://www.downeastmicrowave.com/pre-cat.htm

Guess that you don't work the weak signal modes and use transverters to
do so. If you did you would know that the vhf and above bands are
wider than the 1.7 megs that you cover while still in the 10 meter
band. Should also mention that I have a low band rig opened up for the
full coverage just so that I can work 6 meters while using the low band
rig around 14 mhz. Six is 4 megs wide and the 20 meter ham band is less
than .5 meg wide.

This has nothing to do with a nice try. It is the facts.

Tried to hook up DX-70 to Heathkit SB-200 with all the mods. Cut resistor. RCA cables between ALC's on radio and amp and from relay on radio to ant relay on amp. Amp keys but that's it. So went back from radio to tuner, S meter on radio shows transmit as does transmit light but nothing into tuner. Soldered resistor back, same story. So I obviously hooked it up wrong or did something wrong, but does anyone have any idea what. How is it supposed to be hooked up? Is there a way to fix the damage short of sending it to Alinco?

Source record: 50134
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi All ---

In my earlier message I wrote them Standard HT model numbers from memory, incorrectly I might add. Therefore, I would like to correct my posting and state that the Standard HT's that I reallt do have are as follows: C168A, C228A, C528A, and C628A.

I am still looking for extended TX mods for these radios. I have reviewed the suggestions made so far, and the keyboard sequences are not working for me. Specifically, the FUNCTION + D combo produces a tone which indicates it was not accepted. This is probably because this key combobation is used to assign memory channels, and the mode radio is in at the time it is pressed is not valid. Thought's anyone ?

I got one suggestion which would require openning up the radio and perform some micro-surgery on the/ curcit board. Thanks for the suggestion, I am saving these suggestions on the last resort pile. I am resonably convinced that with all of the smarts in the radio, that some key-combo should do the trick. After all, the MARS/CAP mods on the radio cannot not be that difficult.

Andy,
73 de N9KWS.

Again, if you guys would read, I said that this would be speaking to an amateur radio operator with an amateur radio. You are referring to a modified radio and you can't prove that it is legal to use a modified radio. That section, which I, too, quoted says no where, that it is legal to use a modified radio.

Guy P. Distaffen

KB0SWS

P.S. Please read my entire post before throwing this same argument out. This would be the third time now and still my response was covered in my original post.

7842. information needed kenwood ts-140s

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-24 06:55:19 UTC
From: Dust Might <alfaromeodiscovolante@hotmail.com>
Message-ID: <rjAV7.12861$PO5.2033568@newsread1.prod.itd.earthlink.net>
Source record: 50146

Hope this is the right newsgroup...I just bought this Kenwood radio yesterday from a fellow at a flea market whom said that if I hooked it up to a battery and (some kind of ?) antenna that I could use this in my pickup truck (Ford) for talking CB. I paid $170 for it because I figured the bigger the better...was this too much? Will it display 19 or 40 chanels or some kind of frequency numbers? How much power does it have? The wires seem simple enough...(I presume) black for ground and red for positive. After visiting Radio Shack, their magnet mount antennas have the same connector as the one in the back of this radio...anyone with suggestions on which antenna to use with this Kenwood; should it be a short one or one of the bumper-mounted long ones? I want it to "get out" as much as possible. It came with a large (police department style) microphone, but I would rather have a hand held model, instead...where can I find one or would someone care to do a swap? Lastly, I'm planning to use Velcro to hold this under my dash...is this the best method?
Thank you in advance for any help,
-Dusty Red in Dixie

Assuming you can't see the antenna and mark it for past tuning
successes, is there a fast way of getting it adjusted for the
frequency you want?

Could you do it with an SWR meter? You would set the radio for low
power on an empty frequency, turn off its ATU, and -- while
transmitting -- run the antenna motor until you had the lowest SWR.

Hi All,

I have a TS-520 with the 500 Hz Kenwood CW filter installed and am considering purchasing the International Radio 250 Hz filter. It occurs

to me that it may not be too difficult to modify the radio to accommodate
both, so that I can switch between one or the other, or perhaps, run the two
in series.

I would appreciate hearing from anyone who can offer suggestions and or advice on this matter.

Thanks and Happy Holidays.

Bob
N7ND

P.S. Thanks to those who responded to my question regarding the VOX relay, RL1

7852. Bad battery

Hi Folks:
I've been working on an Icom-u2at. My uncle keeps it in his truck powered-up. Three cells were bad that I changed only a few months ago.. Looking over the circuit in the battery pack, the 13.8V in jack seems to do the same thing the 'wall charger' jack does - charge the battery. Obviously, the Ni-Cads are always charging even with the 13.8V jack, and the radio always runs off the ni-cads..
Can this radio handle 13.8V in? I 'Need' to rewire this 13.8v away from the ni-cads and preferably run the radio off this jack, even if I have to regulate it.. Is there another battery pack that is 12V instead of 7.2 or 8.4?
Thanks!
Harry

Wanted: Icom 775DSP, 756 PRO or possibly Yaesu 1000MP. I have the following NIB high-end stereo equipment to offer in trade:

Rotel RB990BX 200 WPC High Current Amplifier
Rotel RCD971 CD Player with HDCD
Rotel RC971 Preamplifier

Equipment is mint in their original boxes and packing material.

e-mail if interested in trade: bbwolf@mailcity.com

: interior of the car warms up with condensation forming on the circuit boards
: etc. I'd like to hear from ops running similar rigs with any problems
: they've encountered. 10m is only going to be open so long!

One thing I haven't seen mentioned is the effect of cold on LCD displays.
I have a couple of pieces of equipment that have had their LCD screens
damaged because of cold. In one case an HT, a Radio Shack HTX-202, that
was in luggage on the back seat floor got black splotches around the edge
of the display, even though the car was running with the heat on for
almost all of a 300 mile trip, with just an hour stop where the car cooled
down. This was on a cold but not atypically cold East Coast day, with
outside temperature from 0 to 10 F.

I'm not sure this is a problem with all LCD screens, I'd like to hear
from anyone who knows if newer ones are improved in their resiistance to
cold. But my experience has made me wary of leaving any gear with an LCD
display in a vehicle overnight during the Massachusetts winter.

I haven't run across an LCD damaged by cold but I have had them unreadable until they warmed up. My Palm Pilot is an annoying example of that. Some of the mobile rigs have incandecent back light bulbs which I imagine helps to warm up the LCD faster.

Hi
what i found sucessful was the use of one of those radio shack digitial
watt swr meters has a small controll head is auto read.
low power to rig on desired frq then run sd up or down watch swr on
meter. when you get 1.1 your set you dont have to go back and forth
seting the swr meter to recalibrate it is auto.
you can find one of those meters on here im sure someone has one laying
around they are not using for around 50.00

>I just bought this Kenwood radio
>yesterday from a fellow at a flea market whom said that if I hooked it up to
>a battery and (some kind of ?) antenna that I could use this in my pickup

You got burned. Rig is an amateur rig...not a CB. Put it up for sale and get yourself a CB. The TS140 has no channels...it shows frequency directly. You will probably damage the rig the first time you attempt to transmit ("key it up") and it will cost you several hundred dollars to have fixed. Heck, if you're in/near NC, I might be interested (if so, post back to the NG, this address is blocked).

For the same money, you can get a nice channelized CB. The other problem is that, if you transmit out of the proper band, you will attract the attention of the FCC. That would be one expensive radio!

Of course, you could always learn about ham radio, take the test and get licensed. Then you would see what REAL radio is about!

Cheers;
Andrew

I found that the receive audio and "noise" increases dramatically when the screwdriver becomes "tuned" for the frequency you are listening on. That always got me real close. Then I just used the swr meter in the rig to fine tune it.

73 & Merry Christmas!

Bill

Except that an 'amateur radio' might well be a business band or
surplus public safety radio capable of using the ham bands without
modification.

It also might be an entirely homebuilt general coverage radio, which
was designed to cover all those bands from the start. Either case is
perfectly legal.

Ahhh. A clever solution with the right price! Just like how you used
to trim a car radio to a new antenna.

So once you are in range, you read the SWR, you jog the antenna up or
down, read SWR, and just keep jogging in the indicated direction until
the SWR stops going down. Let the ATU do the rest.

BTW, did you get close enough by ear so the first SWR reading was
under 3.0?

I use an MP1 (sort of a short, manual screw driver). When I adjust it for maximum receiver noise, the SWR is under about 2:1 and the rig's (K2) internal tuner handles it fine. Given the short coax run I doubt that the difference in loss between 2:1 and whatever I can get by fine-tuning is very significant.

Guy,
You are a hypocrite. It prefectly ok for you to modify your ham radio for business purposes but it's not ok to modify it for possible life saving emergency use. You really should read chapter and verse what you quoted from the FCC. We can all see that you don't have a clue what we are talking about here. Now, I can see you writing off your ham radio gear as a business expense.

I've talked with my friend in communications law, and opinion is as I said in a previous posting.

I guess it all depends on how handy you are. I'm sure it could be
done, but myself I don't think I would want to do it on an old classic
radio like that.
Do you really need that tight of a filter? My solution here would be
to keep the 500 hz filter, and plug the sound output of the rig to
your computer sound card and use a readily available DSP filter. The
blowby should be fairly small considering you already have the 500 hz
filter. And the DSP lets you "carve out" any width filter you want.
Also you have the option of multiple filters, and bandpass, bandstop,
and some have noise filters and auto-notch. Some of these programs are
free. Chromasound is pretty powerful and drag and drop filters, but
it's payware. They have a working time limited "15 min at a time" demo
you can try. There is a DOS program called SbFFT that is free on the
net, and works well. I run it from a dox box in windows ok.Also you
have the boxes such as the MFJ filters, etc, etc. I run a 706g totally
though a computer card at home. Gives me all the toy's and dsp, etc
with one connection. And being I have two good speakers in stereo, the
audio is real good. Makes this dinky 706 sound like a 756, and I have
the outboard DSP power to match. Also, if you set up to do that, you
would be good to go for receiving sstv, psk31, etc, etc. But , it's up
to you. I don't know how I would go about adding two filters to the
rig. Maybe a small sub board to hold the new filters or something..I'd
rather just use the easy DSP route myself I think. And the DSP is

pretty powerful for bandpass shaping. Should work great being you have
a real 500 hz filter in front of it. :/ MK

No, no hypocrisy here.
It doesn't say in the rules, whether it is legal to modify a radio or whether it is legal to use that modified radio to transmit on public safety frequencies. I am willing to bet that the public safety officials in your area, would totally disagree with your communications law friend. I know that the ones in my area disagree with him. I live in a small town area and I have talked with the Sheriff personally on this topic. He can't quote any specific laws that make it illegal, but his dispatchers and deputies are told to ignore any unauthorized transmissions on their frequency. However, they do record it for use in court.
Now, like I said in my original post, this is a "can of worms."
Everyone has gone onto tangents from the main subject and you all are missing the point that I made.
My point, in a nutshell, is that no where does it say that an amateur is allowed to modify his radio, it doesn't specify that an amateur can use a modified radio to get emergency assistance in any "means at their disposal," and I have yet to see someone prove this "PSO" statement.
Now, for the ultimate point. These are all hypothetical situations. If you were to look at the reality of it all. If there was a life threatening situation and there was no cell service, no hams listening, no autopatch, no repeaters, then most probably, you are in the wilderness and probably won't get through to anyone on public safety frequencies, either. The U.S. has ham radio repeater coverage for almost every area imaginable.
You are quick to throw out the insults and to try to say that I am wrong, but you haven't been able to back up any of your statements. Are you involved in RACES, ARES or some other amateur radio emergency communications? What experience have you, with this subject? I personally, am involved in ARES, SKYWARN and the National Traffic System. I am working on the training for RACES, which does require special training. I have worked with the local authorities in this area with a few emergency situations and know that in my area, even with my "police buddies," I am still going to face legal problems, if I transmit on the public safety frequencies.

If you want one in that good a shape, I'd just buy a new one. The
reason being the warranty. That one year warranty can be comforting if
something goes kaput.
At least it gives you while to do a good burn-in and see if any
problems crop up. I think the ft-100d's are getting pretty low in
price, like in the low 800's or so. I think the 706g has been holding
fairly steady at around 899.,the same as I paid about 11 months ago.
but I haven't checked xmas pricing. But , it would have to be a hefty
price drop under that for me to risk not having the warranty.I bought
a 706g early in the year. My warranty is about kaput soon..Time to
sweat a bit more...:(Either one of those rigs are complex. I sure
like having a burn-in test period to make sure it's ok..I've run mine
almost non stop 24 hours a day since I've had mine. So far, so good I
think.. MK

The point is that radios used in the amateur service are not required to meet the same level of technical standards as those provided for commercial use. Unless you ran certification tests yourself, you don't have a clue as to whether your ham rig meets commercial standards or not.

Most of you guys seem to have conveniently forgotten or are unaware that
commercial business/public safety band transmitters are required by type
acceptance to maintain a tighter frequency tolerance. I don't feel like
looking it up right at this time and I could be mistaken, but I seem to
think that amateur radio is allowed up to +-.1 and commercial is required
to limit at +_.01 in order to minimise the possibility of adjacent frequency
interference, not to mention that the filtering is no doubt tighter as well
in order to avoid harmonic interference..

Never ever place more than 10.8 volts onto the u2AT. There could be a
problem if you attempt to plug it into 13.8 volts, as an internal
short in the charging regulation circuit could apply 13.8 volts to the
radio and surely you will blow the finals. Icom used to make a DC-25
that was a battery eliminator for the u2AT. This allowed you to put in
13.8 volts DC and it outputs 9.6 volts at about 1 amp.

>
> BTW, did you get close enough by ear so the first SWR reading was
> under 3.0?

On 10 thru 20 I could get it real close. On 40 and 80 I had to do a little more "hunting". These bands have a lot more "noise" so it's a little harder to do by ear. On my car I had put some markings on my screw driver, but when it was dark outside I played it by ear.

BTW, No need to use a ATU with the screwdriver. I never did. That was one of the reasons I why I chose the screwdriver. I could always get my SWR to 1.5 or better. On 10 thru 20 I tuned it to the center of the band and could work the whole band without retuning. On 40 and 80 I had to retune within the bands.

Titan 10m mobile in excellent condition although I no longer have the stock mic,

http://www.bills2way.com/equip/titan_mobile.html

Also have Palomar (blue face) 225 amp to go along with it. Amp puts out over 200W on 10m. Was recently used as mobile setup until I installed my FT900.

Not really sure what to ask for it, but will entertain all offers as well as interesting trades, I'm especially interested in mobile HF antennas. Let me know what you have.

73,

Max

I use a Bandhopper from Clancy MT and an IC706 in my mobile, along with a Metron amp at about 700 watts with the engine running. Should I be out of resonance, things might be hard on the amp, so I use the SWR indicator on the radio, tune at about 4 watts to the antenna and then kick in the amp at resonance. Works fine on my pickup. The antenna has a brightly painted screw head that shows where the slide is and can be seen from my driver's mirror.

The face plate comes in the house with me each night. I was more concerned about the "guts" part under my seat. After XMAS I plan on taking the seat back out and shortening all cables to just needed lengths and maybe put a plastic liner between the rig and carpet for moisture protection. I was thinking about taping a garbage bag around the rig except for the heatsink area to protect the front panel and rear from moisture. Any recommendations against this?

Cross-posted to: alt.ham-radio.mods,alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment

Actually, the way I read the rules...

If you have a radio that 'started' as public service, and you put
HAM frequencies, some rules interpretations can be so strict as
to say the radio is no longer legal and accepted for the PS bands.
How could this be so? Motorola, for instance, doesn't certify
that some radios will meet receive emissions if they are programmed
for frequencies out of the band they are certified for.

Besides, the only time the radio COULD emit something out of
spec would be while it was set to HAM frequencies, and then you
could argue it was legal there, EXCEPT that it would 'technically'
have to be tested to make sure that when it was back on PS
frequencies it was still compliant.

On the other hand, once a radio for PS is programmed for HAM,
it is now 'legally' a 'multiple service' radio, and that is SPECIFICALLY
prohibited in the type acceptance for some radios. Is there a valid
reason for this prohibition? Doesn't matter, it's a LEGAL technicality.

Is this a real life practical example? NO! I'm just saying what the
rules COULD be interpreted to mean.

Now consider HAM equipment brought to PS frequencies. A violation
all the way around. There is NO WAY to do that, period.

Now, what can you 'get away with' is another story. Some individual
departments don't 'look into' issues when their members have their own
radios. It's always 'assumed' that they are 'compliant'.

As an outsider? Making an emergency call? Come on!! It'd better be a
DAMN EMERGENCY. The kind with SERIOUS loss of property or
a life involved. You'd better well treat it like you would a concealed
handgun in NYC without a permit. If you need the tool to do the job
to protect life or property, and you're willing to loose some rights or
privileges to use it, then by all means, do so. But be prepared because
you know that SOMEWHERE up the line in the chain of command
SOMEONE will question it. And you'll have to provide the answers.
Some of which will have consequences you won't like.

If that happens, and you EVER even HINT at any kind of 'justification'
for being able to do it, you can bet your sorry ass the investigation will
now turn to what the hell you were doing UNAUTHORIZED on a
PS frequency. It's just human nature. If you're dumb enough to push,
someone is going to push back, and THEY will have the letter of the
law.

If you had a radio that received but not transmitted, and you did a hardware mode that ONLY opened up tx for 'them', they surely won't like it. If the mod opened up for something else and just happened to also open up for 'them', well, it'd probably be secondary and not a big issue. Best would be if you had a mod that did VALID things and happened to open up for 'them'. Link my Alinco DR-590. There is a single mod that allows 'cross band repeat' operation. That same mod opens the radio up to TX wherever it can RX.

Bottom line is I see some REAL IDIOTS posting with all kinds of 'rights' and 'justifications' for this. In a real life situation, you do what
you have to do, and weigh the consequences against your actions. If the consequences are detrimental to you, you DON'T start this BS argument that it was 'justified' with the authority that has every reason to be concerned. Are people that stupid?

7892. Elevating the ground plane on a "screwdriver" antenna

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-25 13:28:16 UTC
From: cprstnc1zz@optonline.net
Message-ID: <3c287959.130084015@news-server.optonline.net>
Source record: 50097

I am looking into using a "screwdriver" antenna in a base station.
The more I read about it, the less I know. Which of the following is
true?

(a) The"screwdriver" antenna is an end-fed vertical antenna.

(b) The ground plane for a vertical HF antenna mounted to a vehicle is
the earth itself, to which the antenna is coupled by the capacitance
between the vehicle and the earth.

(c) An artificial ground plane for any elevated end-fed vertical
antenna should be at least 1/4 of the wavelength in diameter. This
means for 80m you need 60 ft. long radials.

Based on the foregoing, I have a few questions, for which I can not
get answers from anywhere else:

(1) Assuming you could manage the 60 ft radials for an elevated
vertical antenna, is anything gained by elevating it to, say, 36 ft?

(2) How does a screwdriver attached to the bumper of a large vehicle
compare in signal strength to a 36 ft high, 1/2 wave dipole?

(3) If you wanted to use a screwdriver at ground level, is there a
more effective way to link it to the earth than the capacitance
between a hunk of Detroit iron and the earth? How about putting it
atop a field of ground rods, right on the ground?

Mike I think your right on the money on this one.

Everyone needs to consider that Part 97 is the"Amateur Radio"
rules and regulations. That means that when it says any frequency
available it means any "HAM" frequency available, as that's who
the rules are wrote for. You've got to keep it in the context that
it was written, wrote about "amateur radio" for "amateur radio
operators" to govern the "amateur radio bands", NO OTHER
FREQUENCIES OR SERVICES!

Just my $0.02 worth, let the flames begin.

Hi Mike,
You've managed to put some objectivity back on what seems to be pretty clear to me from the start (WRT emergency comms). "STUPID/IDIOTS" is kinda harsh but I feel your frustration. How does that make you FEEL?:))
Anyways, back to the grind.
What seems to muddy the waters, IMHO, is the apples & oranges of different services with different regulation. Business, PS and other professional services are much more regulated in their equipment, but, ham radio seems to err to the flexible side. Ex: Modification of PS, GMRS, FRS, etc. xcvrs is frowned upon and often outright prohibited. However, ham "experimentation" is wholeheartedly encouraged by the gov't. I'm not going to quote Part 97, since it's been done a couple of times already. I think that when we're modifying ham radios, it's a mistake to selectively apply the regulation of a different service other than to help us better understand how Part 97 fits into the big picture.
The government gives us a great deal of respect in that it believes we can police our own and that's uncommon. I thought for a fleeting moment, "Sheesh, why don't we just ask the FCC?" Of course, Nobody wants to do that! Hence, what we say here can be a healthy thing. I don't think we'll see too many, "How can I make my 50W mobile xmit to my girlfriend's FRS?" posts for awhile:) I honestly put much less confidence in a lawyer than an experienced ham to "interpret" the what's & why's of Part 97. Lastly, when we have to interpret regulation of *our* radio service, we have to operate in the most Correct fashion and not the most Convenient or Unaddressed.
Cordial 73 & Merry Christmas,
Drink, WP3JQ

One more question:

(4) How high above the earth can a screwdriver be mounted if it is using the earth as its ground plane? Apparently 6 feet is not a problem because vans are that high and the manufacturers tell buyers to mount them higher than the roof.

Harold:

I use the AH-4 auto tuner.
I use it to tune long wires, dipoles (with a balun), light bulbs.
So far I have been unable to find anything it will not tune.

And its fully automatic

Using the advanced measuring stick of "if I can hear them I can work them"
its been 100%

As a user of the business radio frequencies, and knowing what it cost our company to have each of our Motorola radios installed (about $700 apiece), I can't say that I would appreciate a bunch of yahoo hams interfering with my business transmissions with their hacked handhelds or whatever.

If you want to do ham radio, get a ham radio. If you want to do business radio, get a friggin' business radio that's type accepted and properly installed. I have no sympathy whatsoever for cry babies who say, "Aw, gee, I hate to have so many radios clattering around in my truck."

Grow up, guys.

>
> It makes no sense to manufacture something that does several things, then make a
> circuit that prohibits some of the things from working.

Sure it does. If the intended user is not legal and never will be legal to use that radio on the other frequencies except in a dire emergency, I think it makes perfect sense. It helps keep some people out of trouble and for sure kills any accidents in their tracks." such as mike sitting" Now, I have no qualms about anyone opening up their rig, as that doesn't mean they are going to use it out of band. But any "normal" out of band use, is illegal. Period. A ham rig will never be legal to use on any other service unless the fcc changes the rules, and thats fairly unlikely any time soon. You want to do it? Fine, but you are breaking the law no matter how you try to rationalize it in your head. I just want to make sure all people that do this realize they are risking fairly severe FCC problems every time they use a ham rig out of the ham bands. Sure, the risk of getting caught is low, but if caught, the fine could be fairly hefty. Probably more than the cost of buying the legal "certified" radio in the first place. Probably more than two or three of them...:(I could open up my 706g, but it wouldn't add a single kc of additional frequencies for me to be able to legally use. Not a a single cycle even. I have no plans to become a "sickbird" any time soon, so what would be the use? To see if it would work? I already know it will. It already receives everywhere it can go, so that can't be used as an excuse. If I had a real emergency I can always break the resister on site if needed. I'm not going to hold my breath waiting for that to happen though. MK

> means for 80m you need 60 ft. long radials.

For best results yes, but for a limited amount of wire, it's best to
use short radials that give more wire under the base of the antenna.
That is where the currents are highest. Also in such a case of wire
scrimping, you really don't need radials much longer than the
radiator. But yes, to work like a hose, you would want about 120 1/2
wl radials to do it up first class. Thats the normal standard for a BC
station. Also radials laying on the ground or in the ground are
detuned by the ground, so don't need to be measured to resonance.
Would be a waste of time. Only elevated radials need to be resonant.

>
> Based on the foregoing, I have a few questions, for which I can not
> get answers from anywhere else:
>
> (1) Assuming you could manage the 60 ft radials for an elevated
> vertical antenna, is anything gained by elevating it to, say, 36 ft?

Sure, much lower earth losses. Say to equal the "magic" 120 radials
used on a ground mount for near optimum performance. At 1/2 wl high,
you only need 4.
At 1/4 wl up you would need about 8-10. At 1/8 wl up, you would need
about 60. All the above would have the same appx ground losses.
Elevating can save a lot of wire. Also clears ground obstructions
better.
>
> (2) How does a screwdriver attached to the bumper of a large vehicle

> compare in signal strength to a 36 ft high, 1/2 wave dipole?

Depends on the freq, distance, time of day, etc. In many cases, the dipole would eat the vertical for lunch. other times, paths , the vertical could win.
>
> (3) If you wanted to use a screwdriver at ground level, is there a
> more effective way to link it to the earth than the capacitance
> between a hunk of Detroit iron and the earth? How about putting it
> atop a field of ground rods, right on the ground?

Nope, a field of radials. Ground rods aren't very good for rf grounds. And being the vertical is so short in WL, the radials are a very critical part of the antenna. You'd need at least 60 to do a good job with that short of an antenna. More would be better. It will work with less, if thats all you can do. But don't expect to be a pileup buster.

I've been following these threads, and it has been educational as I anticipated. Some of you seem to be very opinionated against it, but I still plan on opening the frequencies on my radio. Because of what I learned in this discussion I will also be checking into what the frequencies are used for that are close to the ones I plan on using, (Communicating with multiple businesses that I contract to.) and checking the (pardon lack of terminology) accuracy of my transmitter. I'm hoping to find that here in the interior and northern Alaska, with so few assigned frequencies, that there will be no fear of bleed over to anyone elses. If it wont work, I'll be quering for solutions. Don't wish to step on anyones toes, much less have Uncle Charlie scolding me. Just wish to do my work safely.

Best holiday wishes to you all *<]:o)

7914. Microphone for Icom IC-228?

I have following Test equipment for sale:

Bird Model 3180 FM Deviation Indicator. Adjust FM Deviation via the LED or with supplied ear phone. Unit runs on 9 volt battery, (supplied), and is in excellent condition. Will handle a max of 10 watts input power.
Pictures can be seen at:
http://home.att.net/~fallen-idc/idc/bird1.jpg

http://home.att.net/~fallen-idc/idc/bird.jpg

Bird Model 8072-1 Coaxial Dry Load. Will handle up to 300 watts continuous when bolted to a suitable heat sink, (supplied). Frequency Range dc to 2.5 GHZ, (VSWR dc to 800 MHz 1.1 max, 1.25 800-2.5 GHZ). Size: 4 25/64" x 2" x 1 /32". Unit weighs, (with out heat sink), 12 ounces. Picture can be seen at:

http://home.att.net/~fallen-idc/idc/dummy.jpg

Tektronix DA 4084 Programmable Distortion Analyzer. Fully automatic Programmable Distortion Analyzer. Unit is in excellent condition.

http://home.att.net/~fallen-idc/idc/tekda.jpg

Hewlett Packard Model 8640B RF Signal Generator. This is the military version of the Commercial 8640B. This unit goes to 512 MHz; it is in very nice condition. Picture can be seen at:

http://home.att.net/~fallen-idc/idc/8640m.jpg

Hewlett Packard Model 8640B RF Signal Generator. This is the commercial unit and goes to 512 MHZ. This unit comes with options 001 and 003. Unit is clean and in good working order. The power switch does not work so it has been hard wired to power up when it is plugged in. A picture can be seen at:

http://home.att.net/~fallen-idc/idc/8640b.jpg

I will warrant all equipment for 30 days, (except the power switch on the commercial 8640B. Serious offers only. Buyer pays all shipping and handling charges. I will ship Fedex or UPS only. Over seas sales welcome. Will also consider trades for other test equipment.

Thanks,
Fred

That's a laugh, considering this newsgroup, rec.radio.amateur.equipment,
isn't a forsale newsgroup. It's for the discussion of amateur radio
equipment. The fact that people mistakenly post their forsale ads,
not just for ham equipment but for computers, old audio equipment and
once even guns, does not make it a forsale newsgroup.

One proper newsgroup for ads is rec.radio.swap

So if people like me who don't like the ads in this newsgroup
unsubscribe, then we won't be around to answer questions about
the equipment.

I don't make a distinction between forsale ads and auction announcements;
they both don't belong here (or in the other newsgroups in the
rec.radio.amateur.* hierarchy, for that matter).

Source record: 50023

Thank you for your helpful response.

With 60 fairly long radials needed at ground level to make a
screwdriver most effective, I guess the tripod mount with three narrow
ground screens sold by High Sierra is less than optimal:
http://www.hsantennas.com/mountsf.htm

I am left with one question, though. All the folks using the
screwdriver as a mobile antenna are getting performance they find
acceptable. They don't have 60 long radials; only a 6'x18' footprint
pickup, van or SUV--situated nine or so inches above the earth.
Doesn't this mean that you ought to get OK performance from a
screwdriver if it uses a 6' x 18' ground screen? Or a 10' X 10'
ground screen, for greater uniformity of propagation?

Wellllll, you can get either one for $819 from Texas Towers. You're not going to find anything much cheaper, if you want late models -- no junkers. And the new ones got a warranty... you may need it if you go with the Yaesu.

Mike,

That all sounds fine and dandy. As a police officer, I will say that you would be in serious trouble with any unauthorized transmissions over police communication channels. If an emergency arises, there are enough people, possibly even yourself, with cell phones to make the call. Another option is using a relay with another armature on the air to call the police, fire board, etc.

The original mic was a HM-14, which is out of production though some
dealers may have one on the shelf. Icom does have a non DTMF mic HM-12
that will plug right into it.

I can't believe that so many of you people just don't seem to understand or give a rat's rear end that IT IS AGAINST REGULATIONS TO USE A NON TYPE ACCEPTED AMATEUR TRANSMITTER ON COMMERCIAL/PUBLIC SAFETY FREQUENCIES!! Just like the example I used about the motorist who drives like a unsophisticated selfish idiot, offending everyone in sight because there is no cop around at the time, does this make it okay and acceptable just because you think that you can get away with it? My son caught one of them at a red light and pounded the crap out of him through the guy's driver window when he thought that he was sitting pretty, so don't think that just because there is no immediate threat that you're gonna get away with it indefinitely, cuz it doesn't always work out that way. Do what you wanna do, but what ticks me off is the pomp and haughtiness some people exhibit in the process..

> Best holiday wishes to you all *<]:o)

Right. Why don't you ask Santa Claus for a commercial band transceiver?

Who said anything about using it for illegal or non-emergency
situations???

He clearly stated all sorts of stuff about not wanting to get the FCC on
his case, so I don't know why you decided to change the subject. It is
perfectly legal (and more importantly ethical and lifesaving) to use any
frequencies at his disposal in an emergency. But he can't use those
frequencies that are not accessible without doing the modifications, and
no one will have time to do the mods during the emergency, so they have
to be done now.

Not if there is an emergency. If you had a ham license, you would know this.
(or SHOULD know this)

I applaud that he will do the mods despite your anger, and the fact that you can
get so angry about it make me laugh so hard my sides hurt, so I thank you for
bringing more laughter into my day!

Oh by the way, all of my radios have been modified as well, and they are going
to stay that way.
Nothing you can say will change that, but if you WANT to go ahead and reply to
add to the laughter, go ahead.

I have a Swan 350 that has all the known mods done to it.

I am tuning it according to the instructions but it keeps saying no power at the power/swr meter.

I have made contacts with it. My antenna analyzer says the antenna is fine.

Anyone have any suggestions?

Thanks.

Yeah, I've got a general ticket and I don't know of *any* allowance in Part
97 which authorises an amateur radio operator to transmit on public safety
or any other bands which they are not licensed for, nor to use a non-type
accepted radio to do it. And *you* should know this..

I believe it is *ILLEGAL* to modify an amateur radio to tx out of band into the PS freqs... and illegal to use it even if there is a life/death emergency.. just like it is *ILLEGAL* to carry an unlicensed concealed weapon into public places. Your intentions maybe honorable but still illegal. *BUT*, there are times and places where it maybe wise to do/use/carry one or the other or both and be prepared to face the legal consequences of the strong arm of law. When/if you use a modified ham radio in a PS frequency, then you will be at the mercy of the local PS/federal agency. I would rather face the judge than the coroner in this situation. Some local/small agencies may not give a rip if the transmission is reallllly legitimate but I bet you the larger city agencies will be pissed as all get out and will go after you. Unless your illegal transmission/usage prevents a huge tragedy, such as the World Trade Center or Columbine School shooting or ? Either way, you will be hassled by the law.

My two cents.

Now before you go and shoot off a flame in my direction,
go read some of my earlier posts in this thread and you'll see
I pretty much agree with you on this one. It's just that story
about your son didn't help any. I agree about the pomp
and haughtiness of some people, just because Part 97 (which
was wrote for "amateur operators" and the "amateur radio
service") said in an emergency it's OK to transmit outside of
your license grant, I think it means in the ham band only. In
other words I have a tech level license, in an emergency it's

legal for me to use HF to summon help, or a Novice using
2 meter would be legal the same way. You have to keep the
context of what your reading in mind. Part 97 = Amateur service
not public safety or business band.

But that don't mean in the right circumstance I wouldn't hesitate
to dial up the police channel and let it rip, a human life is more
important than man made rules any time.

> ground screen, for greater uniformity of propagation?

It might be "ok", but thats about it. The car is elevated a bit off
the ground which helps some. Also cars will vary due to the size,
where the antenna is mounted, and height above ground. The
bigger,higher, mounted antennas work better than a low bumper mount.
The difference in cars, mounts, etc, can amount to a few ohms
difference in earth losses. A big car with a deck mount could have 4
ohms loss, and the same antenna on a little car with a bumper mount
might show 8 ohms loss. With the antenna on the ground, you will need
more radial area than what you have with the area of a car to be
equal. Also a car will vary depending on what it's parked over. A car
on the interstate sitting on that ribbon of rebar, has a fairly decent
ground in many cases. But park the same car over a lossy earth like
rock, and it won't play as well. One thing about the screen, it does
place a lot of metal under the antenna where it counts the most. MK

So what's your point? These are obviously mean for EXPORT!

FCC rules plainly state that type-accepted HF amplifiers cannot function (unmodified) between 24 and 35 MHz. Type acceptance is GENERALLY required for COMMERCIAL sale of radio equipment in the US. HF amplifiers are also required to need at least 50 watts of RF input power before they will function in order to gain type acceptance.

There is no type acceptance required for export sales, so RF amplifiers that function at lower input power and over the 10, 11, and 12 meter bands are fully legal for EXPORT sales. Many of these export models wind up being sold domestically, which is why there is a large supply of illegal HF amplifiers in the US

Not at all, but it sure is effective in dealing with smartasses and cowards who have no concern or consideration for anyone else but themselves. I'm from the old school back when people accepted the consequences of their own actions, and instigating hostilities only to blame others generally brought down not only the wrath of your opponent, but also of the authorities..

> Now before you go and shoot off a flame in my direction,

I assure you sir, that as long you engage in and maintain a rational discussion which refrains from smartassed and offensive remarks, I have absolutely no intention of flaming. I frequent another newsgroup where the status quo and their follower sheep jump down the throat of anyone and everyone who dares to post a comment which disagrees with their opinions, and personally i'm fed up with dealing with people of this calibre because there is only one language that they understand..

> go read some of my earlier posts in this thread and you'll see
> I pretty much agree with you on this one. It's just that story
> about your son didn't help any.

I agree. I thought about this when I read it after the fact, but it was too late to remove it at that point. The reason I said it at all was to draw a comparison between the anarchistic smartasses on the road and the ones who exhibit the same "screw you" attitude in the ham radio arena. The common denominator is that they have no concern for order or other people..

Certainly they are meant for export. The web site sells only amplifiers that require less than 50 watts drive power, and work on bands up to 10 meters. But from the ordering instructions, it appears they accept orders not just from outside the country, but domestically, too. There is also no street address given for the company -- just an 877- phone number.

I'm guessing they are selling domestically.

Bob:

You addressed the point of my original post.

AB2HR apparently did not read the promotional information on the Web site
for these amplifiers.

This site not only sells equipment that the FCC supposedly has banned but
tells one just how they circumnavigate the rules.

But yet, the FCC enforces these same rules in the Amateur arena when they
see fit.

So radios are bad, driving is bad but a son "beating the crap" out of
somebody is worth writing about.
One of those actions is a felony in California.
Personally I'd rather see somebody use the radio against regulations rather
then beat somebody up.

7955. Wanted: FT-900 Schematic

If that were always true, it would be nice.
Unfortunately, the first people on the scene are usually not professional
EMA/EMS/EMTs
I know I'm not a professional, yet my Skywarn activities put me in position
to be first on the scene.

<<SNIP>>

Bob,
Given a scene where a ham radio repeater with or without an autopatch wasn't available, another ham couldn't be raised (probably because of #1) and a cellphone or cellphone service wasn't available.

That's what we are talking about here. The situation has come up before, with me twice, for several hams. In West Texas, unless you know about the Zia Connection repeaters are very scarce. Alaska is another example. Part 97.401 states it fairly well in that safety of life and protection of property is utmost. I'm an ex-Firefighter and have on occasion talked direct with hams on PS frequencies. As an ex-Coastguardsman, I have relayed from 156.800 (Ch 16) to Group via a repeater's autopatch because Group could not hear them. If I hadn't done the fishing vessel would have sunk with all hands on board because the bilge pumps had quit and the ship's electrical had shorted leaving them with only their GMDSS hand held. The FCC asked me about what had happened and I told them. I also told them that given the circumstances again, I wouldn't do anything different. But there is a difference between most hams and myself. I have extensive training in emergency communications as a former member of the U S Coast Guard.

The key word here is allowed. There's nothing in the rules that says
a ham rig can't be built to the business rig specs, and in some cases,
they are. Remember that some VHF/UHF ham gear is just commercial gear
that the mfr set for a different frequency range.

Depends on the feed wire, since the feed wire will pick up about as much signal as the antenna, if it's approximately the same length as the broomstick. If both the broomstick and the feed wire are vertical, the polarization will be vertical.

Could somebody enlighten me on the proper pin connections for adding an Ameritron 811H to my Kenwood TS 870s?

Obviously the ALC pin (pin 6) on the seven-pin connector of the 870 to the ALC out on the amp, but then I get lost.

The second connection required for the amp is the relay. Soooo, which pin(s) do I use for this connection?

Sure would appreciate any help....

Thank in advance.

I do not know much about the Kenwood but for the Icom I use the relay out
from the Icom to the relay in on the amp. I use a switching relay inbetween
the two as the relay in the Icom is somewhat weak.

7971. Once upon a Time (was TT Vx HRO)

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-26 22:31:14 UTC
From: Roger Halstead <rdhalste@tm.net>
Message-ID: <ScsW7.1370$DI1.675711@monger.newsread.com>
Source record: 49975
Cross-posted to: alt.ham-radio.hf,alt.ham-radio.mods,alt.ham-radio.morse,rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap

Once-upon-a-time, and it hasn't been all that many years ago, relatively speaking, Amateur Radio sales was a good business. It was a business where there was a place for large and small dealers alike. It was a time when a dealer could load up and go to a swap and basically bring home the empty van and a whole bunch of cash.

Yes, it was hard work and long days, but there was good money to be made.

Somewhere around the late 70s, or very early 80s something changed. The cost of doing business went up. Overhead went up drastically. Now this was around the time of the gas shortage and high prices. People quit buying big ticket items. Rigs were in the process of moving from tube, to hybrid, to fully solid state.

As a group we Hams have always been known to think our rigs to be worth near as much as we paid for them, even a few years later. Hams came to expect to get that kind of payback and were insulted when people wouldn't offer near what they wanted. If someone else had the same kind of rig they'd say it wasn't worth near that much, but couldn't understand why people didn't think theirs was worth more.

Sooo...we pay as little as possible, taking advantage of the hospitality of those dealers who will take the time to work with us and then purchase where ever we can pay the least. <sarcasm on> Then we wonder why there are so few left that offer in store service? <sarcasm off> Amateur radio is not a high volume market and a dealer has to be able to make money at least in one area.

They either have to make money on new rigs, on service, and/or on used gear.

The profit margin on rigs is relatively small, unlike SUVs where the margin has been much larger than on cars.

A dealer can sell small parts at, or close to retail so those help a lot. BUT as one other poster pointed out, a dealer does not have to make a profit on every sale. What they do have to do, is make an overall profit large enough to pay store rent/lease, or in the case where they own it, taxes. They not only have to take a clerks wages out, but there is SS, unemployment, and a myraid of other charges to be accounted. For a low volume business that overhead can be a killer. By-the-way, one of the big expenses is bad checks. You have to sell a lot of rigs to play "catch up" for just one on which the check bounced when you may have been working on a 10% margin.

When all is said and done, they still have to make enough profit to live on from a low voulume, low profit margine, long hours, business.

It boils down to a dealer would have to have a huge turnover in inventory to be able to offer both sales and service to the customer. Even then, every minute away from actual sales cuts into profits which were not large to begin.

Sooo...In general a dealer can offer good mail order prices, or good personal, in store service with higher prices.

IF I know what I want (I usually do, but not always), I quite often use Texas towers, particularly for tower installation parts. (I've always had the parts within two days) I use a local (more or less - He's within about 150 miles) dealer (ComDac) for those items they can supply. I go to AES for those items I need right away that they are more likely to have in stock.

I've found all of the established dealers are good to deal with. They would soon go out of business if they weren't. Sure, each and every one has something go wrong now and then.

The biggest problem today is that there isn't a good place where the new customer/ham can go and personally get good, unbiased advise. The very nature, due to what most of us expect, percludes such a set up.

Hello Peter,
You might get quite a boost in your hearing abilities with the ClearSpeech Base Unit DSP Noise Filter. It has worked great here. Just today , as an example, I was able to work 3XY6A for an all-time 'new one'. His signal here was so weak I could not hear a trace of him with the ClearSpeech unit turned off. But with it on he was easily q5 and I was able to 'put him in the log!'

Check them out at www.amcominc.com The ClearSpeech homepage

I think they make adapters for them. The main thing is converting to
the modular plug. You could make one much cheaper. MK

20,000 Volt Variable Power Supply - Last Day - Ebay

This magnificent Spellman power supply is variable 0 - 20,000 volts. It has a meter for voltage and a meter for current (leakage). It can be used to perform hi-pot tests, and to verify insulators and dielectric materials. I purchased it to help in the design of a high power RF amplifier.

It works perfectly. It is a rack mount design. The top and bottom are covered with sheet metal, so it can be placed directly on your workbench as well. The front panel and meters are in excellent condition.

I've been told that these sell for about $2000 when new, but I don't know if that's accurate. I purchased it a few years ago at the Dayton Hamvention.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1679201652

Detailed pictures available on Ebay.

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

Dont remember if this is one of the radios, but Icom's website has a FAQ
which mentions certain HT's that lose power to the internal backup battery
if stored for a long time. There's a simple reset procedure to follow.
Good Luck

From: Dan Long <w4tq@mindspring.com>
Message-ID: <a0e0tr$5kq$1@nntp9.atl.mindspring.net>
Source record: 49988

B&W Low Pass Filter - 1500 Watts - Ebay

This Low Pass Filter covers amateur radio bands 160 through 10 meters, as well as the citizens band frequencies. It is rated for 1500 Watts and 52 Ohms impedance. It works perfectly. The specification and instruction sheet is included.

For those who aren't aware, the purpose of the filter is to prevent the unintended transmission of signals (harmonics, for example) above 30 megahertz (10 meters). The filter is placed between the antenna and the output of the transmitter (or transceiver). Aside from helping to comply with FCC regulations for signal quality, it will prevent certain types of TV interference.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1311691324

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

>
> Frank W9LVC

This is one of my own beefs with the current situation. While I fully
support enforcement of
Amateur rules, I am also somewhat resentful that the illegal aspects of the
Citizens Band seem
to be winked at by FCC--which gives rise to the problems we see in the
proliferation of CB
amps and the 10 meter encroachment issue. I know that Mr Hollingsworth
cannot possibly
get every single one of them, but, OTH, I cannot help thinking there is a
bit of unfairness con-
sidering that the ratio of wrong-doers is far higher per capita in the CB
service than it is within
the Amateur ranks. I can go on the internet and visit scores of sites that
promote and sell blatantly illegal amplifiers and so-called "export" radios.
I can find "competition" amplifiers that put out outrageous amounts of
power. I can find those same radios "peaked and 'turbo-tuned'"
with "them 'ere extra channels", and could have one delivered to my home so
long as I pay the
price no questions asked. I can find charts that show (to the untrained)
that all the spectrum
between 25 and 30 MHZ are "free" for the taking and are "channels" available
to the CBer.
Nothing is happening--only a token bust here and there that does nothing to
give the hardened
illegal CBer a reason to think the risk of operating on the "freeband" is
higher than he is willing to accept. I can listen to the lower end of 10
meters and hear AM complete with the country
"hick" jargon, stupid sayings, and squeaks, beeps, and ding dongs. I ask
myself why I WORKED for the privilege of using that spectrum, and FCC turns
a blind eye to those who
encroach illegally upon it. Yes, there have been a few busts--and I
appreciate the effort that
HAS been expended. But there ought to be MUCH more considering that I, an
untrained private citizen, can find "targets" without ever leaving my

basement shack. Yes, there is more
to initiating enforcement than sitting at home reading websites. But, once
those targets have been identified, even I could make a purchase of some
:"illegal" radio or amp if I were an agent
and let the legal eagles take it from there.

The 10 meter thing, as well as the rest of the whole mess, is going to bite
all of us if we cannot
get something done. The citizens who think that their illegal activities
harm no one, that they have a "right" to operate anywhere, anyhow, and any
way they want believe that FCC doesn't
even CARE what they do. So I believe that they won't stop with 10 and 12
meters, but finding
no dogs that bite, they will continue to invade other HF back
yards.....UNLESS FCC is enabled thru restoration of funding, even if
temporary, to deal with this. Also, they cannot act
if we, the legal users of 10 meters, for example, do not report what we
hear.

So, if you are driving the interstate, listen to the lower part of 10 meters
for truckers operating
there--it is VERY easy to spot within the CW subband. Record, take photos,
and take the
tag # of the truck. Yes, I'm complaining, but I AM doing the above, too. I
ask fellow hams to
do the same thing!

> 97 which authorises an amateur radio operator to transmit on public safety
> or any other bands which they are not licensed for,

Then why didn't you check Part 97 and find it if you didn't know?

ï¿½97.401 Operation during a disaster.
(a) When normal communication systems are overloaded, damaged or disrupted because a disaster has occurred, or is likely to occur, in an area where the amateur service is regulated by the FCC, an amateur station may make transmissions necessary to meet essential communication needs and facilitate relief actions.

ï¿½97.403 Safety of life and protection of property.
No provision of these rules prevents the use by an amateur station of ANY means of radio communication at its disposal to provide essential communication needs in connection with the immediate safety of human life and immediate protection of property when normal communication systems are not available.

(b) No provision of these rules prevents the use by a station, in the exceptional circumstances described in paragraph (a), of ANY means of radio communications at its disposal to assist a station in distress.

KEY WORD HERE IS "ANY"

> ALC out on the amp, but then I get lost.
>
> The second connection required for the amp is the relay. Soooo, which
> pin(s) do I use for this connection?

Here's the pinout for the "Remote" connector on Kenwoods:

1 speaker out
2 *** relay common
3 to standby switch (PTT for footswitch)
4 *** relay closed on TX (NO)
5 *** relay closed on RX (NC)
6 ALC input
7 +12V DC on xmit (max 10mA)

If your 811 is not QSK capable, then it's OK to use the relay. If it is, then it is advisable to turn off the relay (Lin.Amp off) and use the +12V (pin 7) for keying the amp - with some additional circuitry, of course.

They still get my answering machine.
By the time it makes it through the second sentence where it explains it's
doing call screening to eliminate telemarketers, they have already hung up.
The whole message is about 10 seconds.
Rarely is a telemarketer there after the call screening which is when I pick
it up, or sometimes let people start to leave a message so I can hear who is
there.
If they don't have the patience to leave a message, I don't worry about it.

The problem is that the local EOC was using the same kind of messaging
system so by the time my recorder starts the message is finished. They know
to call me and how to skip the message.

I've been thinking about doing that to mine. Put a switch in the line that
will activate the speaker as well as the headphones.

I'm going to "guess" that the problem is not in the mike jack, but rather
there is a solder bridge at the chip they replaced. Those things are a
"bitch" to replace even with the proper equipment, unless they are plugins.
Usually they are the flush mount with about a hundred pins. Typically the
replacement procedure is to replace the "entire" sub chassis.

7994. Icom 751A RIT

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-27 05:56:54 UTC
From: Roger Halstead <rdhalste@tm.net>
Message-ID: <GKyW7.1403$DI1.696019@monger.newsread.com>
Source record: 49898

My backup rig is an Icom 751A. The RIT went intermittent, and finally quit.
I haven't taken the rig apart for lack of time, but I'm guessing that it is
either the actual pot, or connectors at either end of the wires from the pot
to the circuit board.

Any thoughts or suggestions. (socially acceptable please)
What's the easiest, and safest, route to getting to the pot and board?

Guy, what constitutes "legal transmissions on the frequencies"
when you are transmitting with equipment that does not have
type acceptance for those frequencies? Does the radio
otherwise meet current type-acceptance criteria?

I checked out my "opened up" Yaesu handheld radio
on a spectrum analyser and found that not only did its
spectral purity degrade when it was operated in the
public safety band, it was far from meeting any type
acceptance criteria (even the more permissive amateur
spec). I would only use such a beast during a true
emergency in which I had no other means of
communications available.

Later, the same "Guy" wrote:

> Again, if you guys would read, I said that this would

> is legal to use a modified radio.

Is this the same "Guy" who wrote the previously cited text?
Strange! Perhaps you are new to this country and don't
know this, but unlike many other countries where the
"authorities" make up the rules as they go along, people
here have all freedoms that are not specifically prohibited.
Even the Chinese are now adopting such a system!

A law does not need to exist in order for an action to be
permitted. The current version of 47CFR97.403 at
http://www.access.gpo.gov/nara/cfr/waisidx_01/47cfr97_01.html
goes so far as to make clear that "No provision of these
rules prevents the use by an amateur station of any means
of radiocommunication at its disposal to provide essential

communication needs in connection with the immediate
safety of human life and immediate protection of property
when normal communication systems are not available."
This has been upheld in the courts.

> I have talked with the Sheriff personally on this topic.
> He can't quote any specific laws that make it illegal,
> but his dispatchers and deputies are told to ignore
> any unauthorized transmissions on their frequency

Your friend the Sheriff is not an expert in communications
law, but his radios are an invaluable tool for him.
Best not to risk causing interference to his department's
communications by using non-type-accepted equipment
on adjacent frequencies. I hope that his dispatchers
aren't foolhardy enough to ignore communications made
in accordance with 97.403.

> P.S. Please read my entire post before throwing this
> same argument out. This would be the third time now
> and still my response was covered in my original post.

Your top-posting (that I had to sort out) was unclear
enough; this makes absolutely no sense whatsoever.

Hello,

Reluctantly selling my SGC SG-237 auto tuner... (3 watts to 100 watts, 160m thru 6 meters) Like new, works like new, hasn't been used in 4 months, purchased an FT-817 and have gone QRP using a LDG Z-11 tuner....AND Christmas is here and I am feeling pressure to let it go.

Please e-mail me for several pictures!

$250.00 in the form of a money order, shipped to you door, Cont. US

What do I gotta do, spell it out for you in simple language that a seven
year old can understand? Commercial radios are FCC *REQUIRED* to spec at
a specific frequency tolerance and spurious emission suppression which is
less than amateur radios are *REQUIRED* to have. Whether *some* mfgrs build
some ham rigs to the same specs as they do their commercial equivalents is
irrelevant because it does not speak for *all* makes and models..

I have no technical specs available to compare each model, though I don't
know of any amateur transceivers which are built to the same specs which are
REQUIRED of a commercial transceiver and unless they in fact are so built,
it would *NOT* be allowable according to FCC regulations to use an amateur
band transceiver on commercial frequencies..

Personally, I don't care what you guys do. What I object to are the haughty
self-righteous attitudes coupled with the anarchistic mindset that some of
you guys are gonna violate the rules whether anyone likes it or not, while
shoving it in our faces as if to say "so what are you gonna do about it?"
Sure, i've violated rules too, but i'm not such a pompous ass as to post
messages on a public information medium using every feeble excuse in the
world to justify my actions while bragging about how i'll never get caught..

Obviously you did not read and digest (comprehend) what I said in the rest of my post you snipped. Please reread (two or three times if not more) what I said.

For one *second*, can you put aside all the ideas about saving someone, some place (more of a morality type decision) and simply answer the question of: *Is it legal/illegal to transmit on a PS frequency with a modified Ham radio?* Simple Yes/No answer would do. After that, then we can discuss/cuss the *MORALITY* of using or not using an illegal device.

One of the amazing facts that I discovered when studying to take the examination for a General Radiotelephone Operator's License in 1981 was that anyone can use any transmitter of any power level on any frequency when human life is at stake. I doubt that the rule has been changed.

When you attact somebody in a car and "beat the crap" out of them it would
clearly come under 245 PC.
As a private ciizen in California, because of the way the law is worded I
would always charge somebody with a felony.

I am thinking of buying one of these radios, any idea where I could download a manual from. Also what do you think of them. Any thing to watch out for in particular?

Thanks for any advice or info

8018. Kenwood DRU-2 same as DRU-3A?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-27 18:49:52 UTC
From: zaax@aol.com
Message-ID: <20011227134952.01541.00001791@mb-ch.aol.com>
Source record: 49922

This may be a dumb question but I still need to ask it. I really would like a DRU-2 for my TS-850 but they are out of production and hard to come by. In looking at the latest AES catalog I noticed that there is a DRU-3A for the TS-570. Can anyone tell me if they are compatable? I bet that they are not but would like to hear from others out there in the know.
Any info on this will be greatly appreciated.

Thanks
Zack Schindler

8019. Fuel pump RFI in 2000 Grand Marqui

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-27 18:52:46 UTC
From: Mark <mg734@columbia.edu>
Message-ID: <26KW7.1115$5c4.146903@newsread1.prod.itd.earthlink.net>
Source record: 49923

Good afternoon folks

The fuel pump of my 2000 Grand Marquis appears to be generating at least an S 7 noise level in the 17M, to 10M bands. I've added a combination of HyPass capacitors and chokes in the external fuel pump leads as they enter the tank, through the trunk. While this effort reduced the original noise level by several S units, it remains high enough to obscure relatively weak signals.

Any suggestions on how to further reduce fuel pump RFI?

My rig is an FT1000MP, antenna is an SGC 303 with SGC 230 antenna coupler

8020. Info Needed on Heathkit HD-1481 Remote Antenna Switch

Newsgroup: rec.radio.amateur.equipment

Private citizens cannot charge people with crimes; the state determines
the charge based on witnesss testimony.

I have enjoyed the transceiver for the past 7 years or so. Purchased it
from an ham friend. Very solid unit. Some criticism on SSB selectivity
but I may not be using the controls properly to phase out strong
adjacent sideband splatter. More of an annoyance than anything else.

I do have both operating/maintenance manuals; the latter is fair sized.
Your call/location please?

http://www.nicdlady.com/

I see it's a fee of 7 bucks to have them replace the cells, probably worth
the change.
I just did my Ft-50 pack today, with some AA-nimh cells, worked fine.
Then I turned around and ordered a AA cell holder pak, to prevent needing
to do it again.

A simple yes/no will *not* do, since neither would be properly true.

Is it illegal to kill someone? Yes/no will not do here either, since
it is perfectly legal in most states to kill in self-defense, and at
least in TX, in defense of third party.

> generically referred to as "Xeroxes"...

Yes, Brenda I agree.
For example; for many decades, maybe still, as far as I know, ALL vacuum cleaners in the UK were referred to as "Hoovers"! And the act of vacuuming also became known as "Hoovering"!
But it's well known debating tactic to offset an opponents statement by pointing out a minor difference of detail; or by detecting, or pretending to detect an error in the opponents information!
On the other hand it's sometimes just nit picking, not ddressing the issue under discussion.
Cheers. All the best for 2000.
Terry.

Message-ID: <a0gfm7$387$1@slb0.atl.mindspring.net>
Source record: 49935

MFJ CW Keyer + Special Features - Ebay

This keyer is the model MFJ-8043. It has some very nice modifications:
- a built-in power supply with an isolation transformer
- two key jacks to pick from: one phone plug and one mini plug
- a switch to switch the dot-dash wiring for the key
- one output for regular solid state keying, and one relay output

The relay output was added to allow keying for some of the old fashioned
code oscillators and transmitters.

For those who aren't aware, this keyer produces the dots and dashes of Morse
Code automatically, but requires a special mechanical key for operation

This keyer does not operate in "bug, semiautomatic" mode; it only operates
in the "automatic" mode.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1311990169

I will be glad to provide additional information. Contact me at
w4tq@mindspring.com

Source record: 49937

For info: Listened, on 15 metres, SSB to an amateur yesterday who was running 1500 watts (Kenwood I think) to a Rhombic antenna pointed at Europe or VK land, depending which way it was terminated. I didn't catch the dimensions but he said the Rhombic had a forward gain of 14dB! What impressed, however, was his courtesy in speaking with several European contacts. He was carefully quoting temperature in degrees Celsius and the approximate distance from his QTH distance to a major US city, in kilometres! Who says North Americans don't understand metric? All the best for 2002. Canuck.

hello,

i have:

1 Swan 500 (not c) amateur transceiver 80-10 meter operation. low output
on 15 meters. cosmetics is 8.5 to 9 of 10.
1 410 external vfo
1 22b vfo adapter
1 vx-2 vox unit
1 117xc power supply/speaker
1 fs-2 field strength meter
1 wm-3000 2000 watt meter
1 sure 444 desk mike with swan logo

i want:

a clean, fully functional heathkit sb-220 amplifier. no junk.

if someone wants to buy the package outright, email me and we can talk. i
will NOT split the package until the radio/power supply has been sold. if
someone wants the rig/powersupply, all other options will be listed
seperate. equipment will be sold/traded as is. this station is in service
in my station at this time and is operational. if a deal is struck, we will
discuss shipping.

thanks

Hi all!
This is the black vernier dial, made by National about 2 1/2" in diameter with a 0-100 scale that sticks out from the knob by about 3/8" The ratio is about 5 to 1. It originally was from a TU6B WW2 surplus Tuning unit (also in TU7B, TU8B and TU10B units) I think from the BC610?)

I have one and need a second one for an antenna coupler I am building. Can anybody help?

actually this seems to be a common mod alot of people make. if your
radio's in a place that won't disturb folks, but you want the option
to listen with 'phones while visitors listen on the speaker, it works
great. can't say i'm unhappy with it...

thanks for the info.

Well, realizing my pack was dead, wouldnt shock to charge, even my maha reconditioner only beeped at it, I knew I had nothing to lose. So, starting at the bottom of the pack, I used a small but sturdy screwdriver and slowly pryed the bottom loose, once this seperated a little, the rest of the edges followed suit. Now, inside it appears to be N type cells, I had a fnb 41. What I did, since it was snowing, and this was a 'boredom' repair, was took 6 nimh AA cells, and put them where the 9.6 volt N-cell pack was. It fit well, all went back together pretty good, and a little contact cement made things solid. (but, still able to be pryed apart.) Voltage off a charge shows 8.3 volts on the DC scale on the FT-50, I've just now started scanning with some transmitting. So far, seems to hold well, the cells I used were button topped 1.3ah Nimh. I'd say if I did it

again, I'd definately use solder-tabs, since they'll make the fit substantially better.
A lot of things still need to be figured out, as-in how long it will last, charge time....etc, but all in all, I went from no radio, to one that works and hits local repeaters. I dont intend to do much handheld transmitting from where I'm at, and if it's mobile or in the shack, it will be running on 13.8 vdc, with an external antenna. I basically just wanted the pack for scanning, and to stop it from losing some of its settings when it's unplugged from 13.8.
I ordered a AA cell pack today. For backups I like the idea of throwing in Alkalines.
Good Luck!!

Hmm, didn't answer the question. Could've said it was legal to transmit
only during a life or death situation. I still don't think it is (legal),
but that is just my opinion. Then why don't ham radios come from the
factory with the necessary modifications to transmit within the PS freq and
make it an honor system for the operator to not tx if there is no emergency?
Seem reasonable if it was legal

>

Off the ham radio thread but I have to ask. Is it legal to kill someone
(self defense) with a weapon that is illegal? Such as an unregistered
concealed gun in a public place? How about if the person has a felony and
wasn't suppose to posses a gun? Is he still legal to do so?

: disposal to assist a station in distress.
:
: KEY WORD HERE IS "ANY"

This is all true, but the reality is that not all public safety entities
seem to recognize or understand FCC jurisdiction. This may
put you at risk for even having a ham radio period. But whatever.
That's an extreme view that you might run into even though it's
wrong.

Perhaps a more realistic view is that unless there is understanding
of some kind of policy among the dispatchers in your area and
unless you know what frequencies and procedures to use, you
may do more damage than good by either wasting critical time, or
by disrupting other emergency communications. The telephone or
cell phone provides the official access for these services and
procedures are in place and have been honed for orderly handling
of traffic. I have a radio that's been "opened up," and I use it as a
programmable receiver and test generator, and it works great for
tuning cavities and filters, but even with a bushel basket of Public
Safety frequencies in my hat, I still would get an emergency
message out more efficiently to the local ARES/RACES repeater
operator on duty who would then route the traffic properly while
my hands are full.

Perhaps the biggest problems with "opening up" your radio is;

1) What is your emergency plan (no BS)? and
2) How are you going to avoid inadvertent and embarrassing
transmissions from your "scanner"?

Jim, AC6TK, etc, etc.

Ok, you've stated your opinion to my question. Your answer is YES, you can (legally) tx on a PS freq with a modified Ham radio, but with a qualifier. Now, the water gets muddier. Just how serious does the injuries have to be before it is considered life threatening or qualify to break into a PS freq. ? Is the person doing the tx'ing a qualified doctor to make that sort of judgement? Some people could consider any number of minor injuries a major deal and so would they be legal to call on a PS system? A cat stuck up in a tree, does that count? How much property must be lost or endangered before it qualifies? Slippery slope here, I know.

Even better, imagine the State Trooper on the side of the road, shot in the chest, unable to talk--but with a radio in the car! But, damn, it's "illegal" for you to transmit on that frequency, and you forgot your cell phone. What's a law abiding citizen to do?

Most regulatory laws are suspended or unenforced in emergency situations. Even a dispatcher who had been trained to ignore "unauthorized" communications would *likely* listen to "DISPATCH, Trooper Smith has been shot, Highway 291 and County Road 5, he needs medical assistance!".

How serious? When you don't have to ask yourself that question, that's when. If you are sitting back calmly asking yourself if the current situation is serious enough, then no it is not serious enough. When you don't have to think about it, just key up and shout for help, then it is serious enough.

God dam are you people stupid fucks! Picture your mother just got thrown out of the car when a big semi-truck crashed into you and no one is answering your calls on the local repeater, your gonna talk on that police frequency, have them take your mom to the hospital and worry about the legalities of the situation AFTER your mom's recovery in the hospital! If she is alive because of your actions and you get fined $1000, do you really care? And what judge would fine you in that situation even IF it WAS illegal, which it is not. (clearly stated in part 97 fcc rules)

By the responses of the fellow hams here, it seems it would not even be worth the precious time to waste calling you bozos on the ham frequencies (you might cause more delay on the radio debating the legalities of if you should call the police for me or not as stupid as you morons are behaving here) I would go direct to the police frequencies!

The fact that licensed hams (you are all licensed, aren't you?) don't even know the fcc rules (that you are REQUIRED to know and keep up with) and have to DEBATE whether or not you would, could, or should use police frequencies to save someone's life shows how stupid most ham operators are. All they care about is keeping the morse code requirement so fewer intelligent people can get on the air and do something intelligent other than beep beep beep beep abbreviations and codes relaying weather conditions and signal reception reports to each other in obsolete, inefficient telegraph mode.

FOAD!!

Hey dumbass, the FCC RULES saying it IS legal was posted yesterday. Here it is again:

ï¿½97.403 Safety of life and protection of property.
No provision of these rules prevents the use by an amateur station of ANY means of
radio communication at its disposal to provide essential communication needs in connection with the immediate safety of human life and immediate protection of property when normal communication systems are not available.

(b) No provision of these rules prevents the use by a station, in the exceptional
circumstances described in paragraph (a), of ANY means of radio communications at its
disposal to assist a station in distress.

And cops don't understand that they can't radar your speed under 500 feet from the speed limit sign where the new speed is first posted, that is why you go to court and have the judge dismiss your ticket and you laugh at the stupid cop for not knowing the law.

WHO CARES if the "public safety entities" don't know or recognize the law? You are going to let someone die because of their ignorance? (look at who I'm asking, of course you would.)

> Perhaps a more realistic view is that unless there is understanding
> of some kind of policy among the dispatchers in your area

Perhaps a more realistic view is that someone under your care would die, and under my care would get quick medical attention. You would be breaking another law by not getting help when you had the radio and ability to do so. You would most likely get sued. And it would actually be because you were an idiot! You might also lose your ham license (if you bozos even have any) for not knowing the rules and regulations that you are required to.

Your 42 years old, you should know better.

Yep, been there done that. Was thanked profusely,
but never asked to identify myself. Saved several folks
from going into a fire trap (during 1991 Oakland fire).
Didn't worry about ramifications for a reasonable act,
and there were none.

> OH MY GOD! Someone with brains is on this

Whew, I too was really starting to worry. Sarah, please
don't for a minute think that all hams are anal-retentive
stuck-up types; some of us actually like to get something
useful accomplished now and again. Our country's
founding fathers would be nauseous if they could hear
all of this nonsense about "ooh, gee, that might be illegal."

You'd better brush up on your California Law and Evidence, because 245A is
Assault with a Deadly Weapon. Battery 242 does not involve weapons..

> As a private ciizen in California, because of the way the law is worded I
> would always charge somebody with a felony.

I would suggest that you exercise caution in making a citizen's arrest at
all, because if the person you "arrest" beats the case you can be sued in a
civil lawsuit for false arrest, and the peace officers which are required to
be present at the "arrest" do not cut any corners advising you GI cops of
this very serious fact. Unless it directly involves you personally, you
would be better off minding your own business..

Are you really so naive, when this whole discussion began over the issue of
how no one has any respect for rules, regulations and order? You have to
build respect for order and consideration for others in the people before
any existing laws are going to be of any significant value or effect, and I
just ain't too darned impressed at the mentality I see manifest nowadays..

Well that is about where it stands now. An emergency situation could be anywhere from a very serious medical condition to Fee-Fee the cat stuck in the tree, depending the interpotation of the person who is calling over the PS frequency. Beleive me, there are people who think getting a stuck cat out of the tree is an EMERGENCY. Now, put the shoe on the other foot. You are the person at FCC or PS agency and someone calls in on a modified Ham radio that doesn't belong on that freq. and calls in a less than emergency situation. What would you do with them?

Heck, take it a step further. Why have a Ham licensing program at all? Allow whoever to own/operate a Ham radio or modified radio to call in emergencies. Arriving home late or picking up the pizza is an emergency to some folks.

Bottom line is, when/if you pickup your modified Ham radio mike to tx on a PS frequency, the situation better be severe enough that you have no hesitation about going to jail (hardly) or be financially inconvienced(lawyer bills, or missed work going to court) by the authorities.

I believe a judges job is to collect the facts of the situation and see if any laws of the country on the books have been violated. If so, the judge takes in all the considerations of the case and either lets the person go (if no laws have been broken) or sentences the person for something. If you are standing in front of the court, then you are at their mercy.

Clearly stated in part 97? Oh I've read it and there are several interpolations posted already. I interpolate that to mean in the frequencies of the Ham bands and not all over the spectrum with a modified Ham radio. I interpolate that also to mean that a lower licensed Ham operator could use a higher Ham classification frequency in times of an emergency. Of course, I believe you could use a commercial grade PS radio to make the call. Example, a policeman is injured and you call his dispatch with his radio to inform them of the situation.

Well Sarah, you've missed my point. All I've said is: It is illegal to use a *modified* Ham radio in a PS frequency under any circumstances. I didn't say if the party should be lightly./severely punished for doing such, just that it was illegal. Period! I didn't criticize the point of the morality of the issue, the possible good Samaritan act the person was doing. Would I use any means possible to save a loved one? Yes. Would I consider

breaking the law to save a loved one? Yes. Totally different issue.
There are two issues here 1) Legality and 2) Morality of assisting an injured person or saving property. Each person has to decide if the consequences of breaking the law are worth it. In certain cases, I am sure it would be worth it.

it is
> again:

Now, now Sarah, no need to cuss and have your knickers in a bunch. I read your post and many others. I happen to disagree with your interpretation. You can do as you want. You can try to justify to yourself and others why you 've opened up your Ham radio and rooted around inside to modify it to tx out of ham freq.. You can also scream and shout (for example) why it is justifiable and possible legal to drive at an excessive rate of speed through a posted school zone to an emergency. I view the tx on PS freq. and breaking the speed limit in the school zone in the same light. Could be a very honorable act, you may not receive any legal actions against you by the authorites (depending) but still illegal according to the books.

New question. Is it even legal (disregard the severity of the issue) to even posses a homebrew modified Ham radio that can transmit on PS freq. ? Don't care if the person has never used it out of authorized freq. Just that the person has the capability to use it other than its intended manufactured purpose. Skip the whole issue of the morality and your mother is bleeding to death on the side of the road example. Would you be willing to go up to your local police department with your mod Ham radio and make a statement that you have this capability?

Back the boat up Jim. This discussion is based upon the point (legality) of
owning/using a *modified* Ham radio to make the call on a PS frequency. Not
using a commercial grade, type acceptance radio your shot police officer
example has.

> Ok, you've stated your opinion to my question.

Well, I have no idea what you want. You ask a question and are given an exact quote from the FCC regulations and then state that it's only someone's opinion. It seems clear enough to me.

You are correct that you must be willing to justify that it was an emergency. I expect if the situation would have justified a call to 911 if normal telephones were available then it is rather easily justified to use the radio. The bottom line is that you probably won't get any exact answers to that question unless you want to take a trial case the the Supreme Court. The safe thing for *you* to do is not to modify your radio and then you will never be faced with the decision about using a PS frequency to save someone's life.

No hard feeling on my part. Adding to your comment. It isn't *my*
definition of legal but rather the *enforcement agency(s)* (of the country
you live in),, definition when/if you ever have to stand in front of them to
answer why you did what you did. I/you may be verrrry wrong but then again,
I/you could be verrrry correct. How lucky do you/I feel? :)

\

I thought it was a fairly clear question; Again: Is it legal to tx on a PS frequency on a *MODIFIED* ham radio . Key word is *modified* as in, it didn't come from the factory that way. Part 97 states you can tx out of your licensed freq privaleges so long as it is for an emergency (whatever degree that maybe) or to save property (again, to what degree isn't really defined either). I take it that part 97 is slated toward the amateur radio group and not a sweep of the hand coveral all

>
> You are correct that you must be willing to justify that it was an
> emergency.

If it is legal, then there shouldn't be any justification to it. Right? :)

I expect if the situation would have justified a call to
> 911 if normal telephones were available then it is rather easily
> justified to use the radio.

Sure would make the person look better in the eyes of the enforcement agencies.

The bottom line is that you probably won't
> get any exact answers to that question unless you want to take a trial
> case the the Supreme Court.

Surprising that bridge hasn't already been crossed. I know, Part 97. I guess you can roll the dice and take your chances.

The safe thing for *you* to do is not to
> modify your radio and then you will never be faced with the decision
> about using a PS frequency to save someone's life.

That is the absolutely *savest* (stay out of legal harms way) personal approach.

Do as you like. This isn't a worldly problem, bigger fish to fry out there, but more an acedemic question/debate

The killing would still be self-defense, but the shooter would still
face charges related to the posession of the weapon.

I couldn't find it in a quick search, but IIRC, there is some
exception allowing for a child obtaining an unsecured gun and using it
in self defense under certain circumstances, but I don't recall the
details.

The simple answer is that it is not legal to transmitt on the PS
frequency with a modified radio.

You can transmitt on any HAM band or frequency with any mode in an
emergency. This is what part 97 covers and not any other service.

What you do in an extream emergency is up to you. I would give a call
for help if someones life was in danger but not for a building on fire
and remain unknown. The law acts in ways that does not make much sense
in many cases. In some states if someone breaks into you house to steal
something you can shoot them, in others you have to believe your life is
in dange before youcan shoot them. That means you just have to watch
your property being stolen while you go to the phone and call 911..

Its funny you keep calling it opinion. When time and again it is put to you in black and white per the FCC regulations.

> No provision of these rules prevents the use by an amateur
> station of any means of radiocommunication at its disposal to provide
> essential communication needs in connection with the immediate safety of
> human life and immediate protection of property when normal
> communication systems are not available.

It says any - that allows for every method of communication. Paper cups with strings, smoke signals, unmodified radios, modified radios, cell phones, pay phones, shouting really loud. You sound like a freaking lawyer talking about interpretation. The spirit and the letter of the law says you can do it. What part of it could not allow for it to be legal? Not to mention what judge in his/her sane mind would punish some body for saving life, limb, and property?

You as a non-employee/member of the licensed organization would not be
licensed to use it. Your argument does not fit the situation.

Would you not use the radio if it was the only method of commutation?
Believe it or not, most courts allow for common sense. If some moronic
prosecutor wanted to bring charges against you for saving someone's life, he
would likely be fired by his community.

Read the rules

AMATEUR RADIO NEWSLINE(tm) REPORT #1272 - DECEMBER 28 2001

==========

A NOTE TO THOSE WHO ONLY “READ” AMATEUR RADIO NEWSLINE(tm)

For those of you who only know of the Amateur Radio Newsline (tm) as a text newsletter we would like to invite you to listen to the audio version. This Amateur Radio Newsline (tm) script is actually written for the “spoken word.” It is recorded each by professional broadcasters and is available for private listening or rebroadcast over your repeater. Three methods of delivery are available: Streaming audio using RealAudio, FTP RealAudio or dial-in telephone. Please visit our website at http://www.arnewsline.org for a list of telephone numbers (you have to pay your own long distance charges) and links to audio servers providing our voice newscast (for free).

de
The Newsline Production Team

==========

Amateur Radio Newsline report number 1272 with a release date of Friday, December 28th, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T.

A not so welcome FCC Christmas present for several hams and an ARRL survey says that most hams no longer want the novice bands. These stories are first on this New Years week edition of the Amateur Radio Newsline coming your way right now.

(Billboard Cart Here)

**

ENFORCEMENT: FCC DESIGNATES KEVIN MITNICK, N6NHG, LICENSE RENEWAL APPLICATION TO PUBLIC HEARING

A convicted computer hacker now has to face an FCC if he wants to keep his ham radio license. This, as the regulatory agency designates the Amateur Radio license renewal application of Kevin David Mitnick, N6NHG, for hearing. We have this report:

--

According to the FCC, Kevin David Mitnick is best known to the world as a hacker who admitted that he broke into a number of computer systems and stole proprietary software belonging to Motorola, Novell, Fujitsu, Sun Microsystems and other companies. He has also admitted using a number of means to commit

his crimes including social engineering, cloned cellular phones ad sniffer programs placed on a victims computer system. Mitnick even acknowledged altering the programming of computer systems belonging to the University of Southern California and using these computers to store programs that he had misappropriated.

Mitnick was sentenced to forty six months in federal prison for his August 9th 1999 conviction. He had previously been sentenced to twenty-two months in prison for possessing cloned cellular phones after his arrest in North Carolina in 1995 and for violating his supervised release that had been imposed after his conviction for unrelated computer fraud in 1989. He is currently on probation following his release from prison in January of 2001. And in December of 1999, Kevin David Mitnick, N6NHG, applied for renewal of his Amateur Radio Station and his General Class Operators License.

His license expired on December 12th 1999. The FCC put the renewal application on hold pending further inquiry. Now the agency has made public that it intends to challenge Mitnick’s right to hold a ham radio license and has issued a Hearing Designation Order. In plain English, that means Kevin David Mitnick has to prove to the government why it should renew his ham ticket or have his license cancelled.

The FCC is challenging Mitnick’s license renewal request on the ground that his past criminal behavior raises a substantial and material question as to whether Mitnick possesses what the it terms as the requisite character qualifications to remain a Commission licensee. The FCC says that in the context of broadcasting licenses, it has long held that evidence of any conviction for misconduct constituting a felony will be considered as relevant to its evaluation of an applicant’s character. It also says that the broadcast character qualifications standards have been used as guidelines in the evaluation of non broadcast licenses including those in the Amateur Service and that the courts have upheld the Commission’s right to do this.

The agency cites two recent cases. That of Herbert L. Schoenbohm, the ex-KV4FZ and Leslie Brewer who used to be KC4HAZ. Brewer, also known as the Tampa Party Pirate lost his ticket because of his unlicensed broadcasting in the commercial F-M band . Schoenbohm lost his based on a fraud conviction of using an unauthorized telephone access device. And the FCC says that any conviction for fraudulent conduct calls in question a licensee’s ability to act in a manner consistent with FCC regulations.

And so the FCC has ordered that a hearing be held before an Administrative Law Judge to determine the effect of the criminal convictions of Kevin David Mitnick on his qualifications to be a Commission licensee. It also says that pursuant to provisions of the Communications Act, the burden will be on Kevin David Mitnick, N6NHG, to provide proof that his license renewal application should be granted. Mitnick was given 20 days of the mailing of the Hearing Designation Order to file a response.

For the Amateur Radio Newsline. I’m Andy Jarema, N6TCQ.

--

The hearing designation order on Mitnick’s license was adopted by the Commission on December 11th but not released until Friday, December 21st. Ironically, less than twenty-four hours earlier, Mitnick had made a guest appearance on Art Bell’s Coast to Coast A-M where he discussed his future plans. At that time he was apparently unaware that the FCC had some plans of its own in regard to whether or not N6NHG will remain a radio amateur and Commission licensee.

The complete text of the Mitnick FCC Hearing Designation Order is on the web at: http://www.fcc.gov/Daily_Releases/Daily_Business/2001/db1221/fcc01359.txt (FCC)

**

ENFORCEMENT: GERRITSON LICENSE PLACED ON HOLD PENDING POSSIBLE HEARING

Kevin Mitnick, N6NHG, is not the only person hearing from the FCC in recent days. So have a number of others including another Southern California resident who could face the same kind of a hearing. Riley Hollingsworth, K4ZDH, is the FCC’s Special Counsel for Amateur Radio Enforcement:

--
Hollingsworth: “We notified a Bell California licensee; Jack Gerritson, ex-KG6IRO, that the Wireless Telecommunications Bureau, had set aside his Technician grant so that a recent conviction for radio interference could be evaluated. Now, he has no authority to operate Amateur Radio equipment until the matter is resolved.”
--

The action to place Gerritson's license up for hearing was taken November 14, 2001 and is based in part upon complaints about the operation of his station and questions regarding Gerritson's qualifications to be a Commission licensee. The FCC says that both issues were raised as the result of Gerritson's 1999 arrest and year 2000 conviction for interference to police radio communications. (FCC)

**

ENFORCEMENT: FCC REOPENS KY-W.VA REPEATER CASE

The FCC is also continuing its crackdown in the area of repeater interference issues. In fact it is taking a second look at a coordinated versus uncoordinated issue in the Tennessee and West Virginia border area. Again, Riley Hollingsworth, K4ZDH:

--
Hollingsworth: “We notified parties in a repeater dispute in West Virginia that we would be reopening that case after information that one of the repeaters is coordinated after all. We had declined to intervene earlier this year in that case.”
--

The letter stating that the FCC is reopening that case went to Michael Horn, KB8GDF, of Lenore West Virginia, Kenneth Brown KF8HL of Davin West Virginia and Carl Tussey, KB4UCE of South Williamson Kentucky. Back on January 24, 2001,

had notified the three that it had received a complaint that they were operating an uncoordinated repeater on 145.390 MHz in Mingo County, West Virginia, and that this repeater was causing interference to the coordinated KC8FKP repeater operated by the Portsmouth Radio Club that uses the same frequency. The matter was closed when the FCC interpreted a notation in the South-Eastern Repeater Associations Repeater Journal that the status of the KC8FKP repeater was not known and interpreted this as meaning that the repeater was also was not coordinated.

But now the FCC says that it has recently come to it's attention that although in the SERA Repeater Journal says that the KC8FKP repeater may be listed as unknown, it is still a coordinated system. Therefore, the FCC is re-opening its review of the issues in this matter. (FCC)

**

ENFORCEMENT: IS A GOVERNMENT AGENCY RUNNING A HAM REPEATER?

Is a government agency operating ham radio repeaters in violation of Part 97 rules? Specifically, the FCC wants to know who is really running the KD6LSO and W6SON repeaters in Sonoma County California.

The FCC says that it has received allegations that the county is in charge not the hams whose call signs appear on the machines. Since a county governmental entity cannot be an Amateur licensee, the FCC is collecting information in order to determine if there are breach of its rules. (FCC)

**

BREAK 1

This is ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, heard on bulletin stations around the world, including Rocky Mountain Radio League repeaters serving Denver and Bloomfield Colorado.

(5 Sec Pause Here)

**

RESTRUCTURING: ARRL STUDY SAYS NOVICE BANDS MAY NOT BE NEEDED

An ARRL study group has recommended doing away with the current novice bands and divvying them up among the remaining licenses classes. Amateur Radio Newsline's Norm Seeley, KI7UP, has the details:

--

An ARRL Novice Spectrum Study Committee has recommended that the League petition the FCC to eliminate the CW novice subbands. It also wants a rules change that will allow Novice and Technician licensees with element 1 credit to be permitted to operate Morse code on the General 80, 40, 15 and 10 meter C-W allocations at up to 200 watts power out.

These are just two of the suggestions contained in a report that will be presented to the Leagues Board of Directors when that group convenes in mid January. The study committee will also suggest recognizing portions of the 80, 40, 15 and 10 meter Morse bands for what it calls ''slow CW operation.'' The committee says that this would aid new operators in enhancing their Morse code skills.

Finally, the panel also recommends re-farming -- that’s another way of saying reapportioning -- reapportioning the current Novice and Tech Plus subbands in part. This, to allow expansion of the phone allocations on 80, 40 and 15 meters.

What will the ARRL Board of Directors do? We should know in less then a month.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP

--

The committee's determinations were based on opinions expressed by 4744 hams who respond to an ARRL Novice Spectrum Study survey launched last June. Those expressing their opinions included ARRL members and also non-members. What’s really interesting is that nearly 61% of those responding were Extra class licensees. (ARRL bulletin)

**

FCC INSPECTOR GENERAL'S REPORT: THE NAMES THE SAME

The latest report of the FCC's Office of the Inspector General contained very few items of intrigue. But according to the C-G-C Communicator, one of the more colorful incidents involved a person who allegedly used the name of an FCC employee to obtain the government-rate for a hotel room in conjunction with a government-sponsored event.

Well, it turns out that the subject was legitimately attending the event, was entitled to the government room rate and just happened to have the same name as the FCC employee. The bottom line: Case dismissed.

The complete report is on the FCC website at http://www.fcc.gov/oig/Semiannual093001-1101.pdf (CGC Communicator)

**

AMERICA AT WAR: NYC PHONE SERVICE STILL SPOTTY

It's been almost four months since the attack on the World Trade Center, and telephone service near ground zero in lower Manhattan is anything but normal.

According to news reports, repair people have restored service to most customers, but thousands of lines still aren't working. As a result, customers complain that some business lines can call out, but customers can't call in.

The collapse of Seven World Trade Center crushed thousands of underground cables at Verizon's nearby switching station. About 200-thousand telephone lines and three-point-five million data circuits were affected. The company says it'll spend as much as one-point-nine billion dollars to repair the

damage. (Telecommunications Online)

**

INTERNET SECURITY: PROBLEMS WITH XP

If you just bought a new computer equipped with the Microsoft X-P operating system, or have upgraded your old one, listen up. The Federal Bureau of Investigation says that you should take certain steps to protect yourself against hackers who might try to take advantage of major flaws that have been found in X-P.

The bureau's National Infrastructure Protection Center says that in addition to installing a free software fix offered by Microsoft on the company's Web site, consumers and corporations using Windows XP should disable the product's universal plug and play features as well. The FBI also warned computer system administrators to actively monitor for specific types of Internet traffic that might indicate an attack was under way.

The FBI did not provide detailed instructions how to disable plug and play. Outside experts also caution that disabling the affected Windows XP features threatens to render unusable an entire category of high-tech devices about to go on the market. This includes a new class of computer printers that are easier to set up. But the same experts also acknowledge that disabling plug and play in X-P could afford some protection against similar flaws discovered in the future.

Microsoft considers disabling plug and play options as being unnecessary but the company does acknowledge that Windows X-P suffers from serious problems that can let hackers steal or destroy data files across the Internet or implant their own unwanted software. The FBI says that the glitches were unusually serious because they allow hackers to seize control of all Windows X-P operating system software without requiring a computer user to do anything except connect to the Internet. (Published news reports)

**

THE LAW: A FIGHT AGAINST GRAY MARKET ELECTRONICS

A group of American high-tech companies is opening the year 2002 with a campaign to protect consumers from unwittingly buying consumer electronic products intended for foreign markets. Electronics that the manufacturers claim may not work in the United States.

Compaq Computer is one of the companies involved in the campaign. It says that the group will warn consumers about the dangers of buying such products, and how to avoid getting duped. The other companies in the group are Hewlett-Packard, 3 Com, Nortel Networks, and Xerox. The effort may prompt more lawsuits against distributors who resell so called gray market items in the United States. (Computer Products Daily)

**

SPECIAL EVENTS: USS ARIZONA K7A A SUCCESS

Steve Gurley, KJ7WK the coordinator of the USS Arizona Special Events Station K7A tells the Amateur Radio Newsline that the event was an overwhelming success. Gurley says that the memorial station contacted amateurs in all 50 states, and 8 other countries while handling over 2600 QSO's. In fact says KJ7WK, the sponsoring group has already received certificate requests from 609 stations as we go to air. There were ten operators in three counties in the Phoenix Arizona metroplex operational during most of the three days K7A was on the air. (KJ7WK)

**

SCHOLARSHIPS: DARA SCHOLARSHIPS FOR 2002

The Dayton Amateur Radio Association says that the nominating period for its annual scholarship program is now open. The deadline to receive applications is June 1, 2002 and the announcement of winners will occur around June 15, 2002. Applications are available from the DARA Scholarship Committee, 9873 Lower Valley Pike, Medway, Ohio 45341. Please note that this is a new address from years past. Again it is the DARA Scholarship Committee, 9873 Lower Valley Pike, Medway, Ohio 45341. Also, for more information on the Dayton Amateur Radio Association and its programs, please visit www.dara-w8bi.com on the world wide web. (DARA)

**

AWARDS: DARA OPENS NOMINATIONS FOR HAM OF THE YEAR

The Dayton Amateur Radio Association also asks that we remind you that the nominating period for the 2002 Dayton Hamvention Awards is now open. There are three awards presented each year. They are the Radio Amateur of the Year, Special Achievement, and Technical Excellence.

All amateurs Novice through Extra are eligible. Awards are decided by the Awards Committee, based partially upon the information received. Magazine articles, newsletters, newspaper clippings, videos and the like are appreciated but cannot be returned. The deadline for nominations is January 31, 2002. Nominations should be sent to Post Office Box 964, Dayton Ohio 45401. They can also be submitted by completing the e-form on the web at www.hamvention.org. (DARA)

CHANGING OF THE GUARD: BADGER STATE SMOKE SIGNALS EDITOR JIM ROMALFANGER, K9ZZ - SK

I’m Bill Pasternak, WA6ITF.

The ham who put the state of Wisconsin on the ham radio map has passed away. This, with word that Jim Romelfanger, K9ZZ died Saturday evening December 22nd of an apparent heart attack..

According to Romalfanger's close friend Ken Ebneter, K9EN, Jim has been in declining health for some time. Romalfanger had a stroke a few weeks ago, affecting his right arm which was already weakened by polio. But Ebneter says that K9ZZ seemed to be improving until just recently. Ebneter says that Romalfanger had been in the hospital early last week but was home when he passed away of an apparent heart attack. In fact, K9ZZ had stopped by to visit a ham radio friend that afternoon. Another friend found him dead that evening when he stopped by to visit.

His full name was Arthur James Louis Romelfanger but to the world of ham radio he was Jim, K9ZZ. And Jim Romalfanger made Wisconsin a ham radio household word by editing as three decade state-wide ham radio monthly newspaper called Badger State Smoke Signals -- and doing so as a volunteer.

Notice we said newspaper and not newsletter. This is because Smoke Signals is just that. A newspaper that at its peak ran up to 40 pages filled with articles about ham radio in the Badger State. In addition to being the 32 year editor of Smoke Signals, Romalfanger was nationally published over the years in CQ, QST, 73, Ham Radio, Popular Electronics, and other magazines.

Jim Romalfanger was first licensed January 1958 in Pacific Beach, California, as KN6LWB. Upgraded to General in May of 1958. He returned to Wisconsin that summer and became K9PKQ. In 1977, changed call to K9ZZ and held that call sign the rest of his life. Funeral services were scheduled for Friday, December 27th at St. Joseph Catholic Church in Baraboo Wisconsin.

Jim, from all of your friends at the Amateur Radio Newsline: We are going to miss you. (The Baraboo News Republic, K9EN, WB9QZB, and other friends of K9ZZ contributed to this report.)

**

AMAZING DISCOVERIES: CIRCLES WITHIN A CIRCLE

One of the most curious pure mathematical discoveries for 2001 was announced in the easy-to-read article at an incredibly long website. In brief the article says that research has led to some remarkable geometric findings involving interrelationships between tangent circles and spheres. In other words, mysterious circles within a circle.

As one researcher put it, "Where do these numbers come from? What's going on here?" Find out by going to www.sciencenews.org/20010421/bob18.asp (CGC Communicator)

**

INTERENATIONAL - CANADA: NEW ALBERTA SM

On the international front, word that Thomas Martens, VE6TRM, has been appointed the new Radio Amateurs of Canada Section Manager for the province of Alberta and the North West Territories. Martens replaces Alan Faint VE6QQ will

be stepping down from the position due to personal reasons. Martens will serve the remainder of Faint’s term which runs through June 30th, 2003. (RAC)

**

INTERNATIONAL-AUSTRALIA: CSIRO MICROTURBINES

Australian hospitals, restaurants and schools could soon source clean, reliable energy from mini power generators that operate independent of the main grid. This as CSIRO has installed Australia's first commercial microturbine, at their North Ryde Laboratory, Sydney.

The size of a small refrigerator, the turbine produces 30 kilowatts of power, independent of the electricity grid. And it does this with reduced greenhouse and other gas emissions. Thirty kilowatts is enough to power a medium commercial building such as a restaurant.

Along with fuel cells, gas engines, storage technologies and some renewable technologies, microturbines can be used to generate power close to the end-user and provide major gains in reliability and power quality. Once the design can trickle down to the home user level and price range, it could offer hams a way of always having emergency power always at hand. (Q-News)

**

SHORTWAVE MONITORING : RADIO NORWAY CLOSES

The Board of Directors of the Norwegian Broadcasting Corporation has decided to stop its own programs by Radio Norway International. This is effective as of December 31st of 2001.

According to DF5SX and G3VGW, Radio Norway’s final show was hosted by veteran broadcaster Einar Lie on New Years Eve. Also, the 1200 kilowatt Medium Wave transmitter on 1314 kHz on Kvitsoy was supposed to cease operation by December the 31st as well.

The Norwegian Broadcasting Corporation will have to negotiate with transmitter providers Norkring and Radio Denmark to close down as well. The Norwegian Broadcasting Corporation and Norkring have a contract for running the transmissions that goes through December 31st, 2003. The agency also has a leasing agreement with Radio Denmark for the same period. (Media Network)

**

DX

In D-X, keep an ear open for King George Island in the South Shetland group. HFZ0POL is reported on all H-F bands, including the newer ones, using CW, SSB, RTTY and PSK31. QSL HF0POL via SQ5TA.

And the United Arab Emerates has been heard lately A61AJ. He has been QRV on 40 meters CW around 1400 UTC. Q-S-L A61AJ via N4QB. (Various DX sources)

**

THAT FINAL ITEM: RILEY SAYS THANKS

And finally as the year 2001 comes to an end, the FCC’s Chief Rules enforcer, Riley Hollingsworth has some words of praise for the ham radio community. He passed them along through his bi-weekly Enforcement Log at www.rainreport.com, and thanks to them, we have is words for you:

--
Hollingsworth: “I would like to point out Hap, that this is the end of the third year of Amateur Radio enforcement and I will honestly say that the overall level of compliance in the Amateur Radio Service is outstanding. The Amateur licensees do a great job and they do a great job of showing that the Amateur Radio Service is -- indeed -- the only fail-safe communications system in the world and we are very proud of them.”
--

And if I can take off my reporters hat for a moment and editorialize a bit, I guess I speak for many who truly appreciate what you have done to return the Amateur Radio bands to the law abiding members of the nations ham radio community. (ARNewsline(tm), RAIN)

**

NEWSCAST CLOSE

With thanks to Alan Labs, Amateur News Weekly, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's Q-News, that's all from the Amateur Radio Newsline(tm). Even that's not simple as you asked it. My radio could have come from the
factory with a bit flipped, thus opening it up to tx on most everything. Or
I could have bought it in another country where the jumpers were set
differently.
I could also say I did not modify it, I used a built in feature.

8090. Ccrane AM (Justice) antenna, any opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-28 19:12:54 UTC
From: N9NWO <2121d@gte.net>

Any opinions? Will this work as reported?

http://www.ccrane.com/justice_antenna.asp

Justice AM Antenna With Twin Coil Ferriteï¿½

"...[The Justice Twin Coil Antenna] makes it
possible to listen to signals which otherwise would be lost. ...It will
make insensitive AM tuners into DX machines!" ï¿½ Joseph Giovanelli, Audio
Consultant

The Biggest Advancement in AM Technology in
Decades! Chris Justice has developed the best
compact AM antenna for a portable radio or home stereo. It increases
available daytime stations dramatically and reduces nighttime fade out
by 99%. The Justice AM antenna can eliminate heavy static on your radio.
In laboratory tests, the Justice antenna eliminated radio noise heavy
enough to destroy all AM signals except those from three strong local
stations, allowing listenable audio from more than a dozen stations. AM
is also subject to distortion, which makes a broadcaster sound like a
duck. The Justice reduces distortion. The Justice is the first AM
antenna designed to bring great AM reception to your home stereo.

The standard unit comes with an antenna element, tuner, and five feet
of cable to go between the antenna element and the tuner. Comes with a
ferrite patch cord for radios without antenna connectors and a patch
cord for radios with antenna connectors. The tuner can be powered by a 9
volt battery or AC adapter (included). The antenna element has an earth
ground lug, which may help to reduce radio noise in some circumstances.

If your reception problem is caused by heavy static and you find weak
stations come in better outside, installing the Justice AM Antenna
Element outside may eliminate the problem. Optional cable kits can be
ordered in 25' lengths to a maximum of 50'. Tuner Size: 3-1/4" W x
4-1/4" H x 1-1/4" D. Antennas Head Size: 8-1/2" W x 2-1/2" H x 1-1/4" D.

There has been some talk about this antenna recently on this newsgroup, including some posts by Chris Justice (the CCRane tech who designed it). If you go to http://www.google.com and click on the "groups" tab, then do an advanced search for the antenna under the rec.radio.shortwave group, you should get some good info. I'd like to try one of these antennas myself, but just don't want to part with $100 right now.
Dave.

It would depend on how widespread they are used. The telemarketers
aren't going to lose the "time advantage" savings just because a small
percentage of calls are lost to the zappers. When a breakeven financial
gain vs. loss point is reached, then they will reconsider using sit tones
as an indicator of a valid number or not. I doubt the penetration of
zappers
is anywheres close to that figure, or that it will be for sometime--unless
Ronco starts telemarketing the Zappers on TV infomercials... LOL.

Sarah,
I think his point about
"Perhaps a more realistic view is that unless there is understanding
of some kind of policy among the dispatchers in your area and
unless you know what frequencies and procedures to use, you
may do more damage than good by either wasting critical time, or
by disrupting other emergency communications."
was to approach the issue with the local police (police chief or rep who
has the authority to make policy). If I'm not misinterpreting, I think it's
a good point. Depending on where you are, it might make a huge difference
(bear with me 'cause I'm thinking aloud). If we're in a very bad
neighborhood in a major metropolitan city, the "policy" or understanding
might look different than in Mayberry RFD on Sunday night. I'm not
suggesting anything about legal issues or whether or not to call if we feel
it's absolutely necessary. I'm just saying that an invitation to the local
Sheriff to come discuss these issues at the local ham club (i.e. concerned,
responsible citizenry & registered voters) would probably payoff. He could
give insights on his personal tolerance for what definitely should
(life/limb) or shouldn't (broke down in the projects) warrant intrusion into
his net. Hams could in turn educate him on part 97 and the remote
possibility of this happening. A better understanding between the two
communities is definitely a good thing. More preparation & training for
emergency communications should also be on the list.
If we are planning to handle an emergency here, we shouldn't plan in a
vacuum:)
Cordial 73's,
Drink, WP3JQ
P.S. As always, if I've said something here that looks totally stupid or
flatly wrong (besides personal opinion) *please* kindly ask me to clarify:)

Get yourself 2 dowels for about $1.00 at home depot and 60 feet of wire and a tuning cap and build your own hi-q low noise directional loop antenna. I did and it works great !

http://www.geocities.com/paris/bistro/3489/mw-loop.jpg

Might not look great but it works great. Better than the Palomar Loop which I subsequently sold after building this. One loop is the pickup loop which connects to coax and then your receiver. It is the center loop. The rest of the loop is about 60 feet of wire and the ends are connected to a tuning cap (50-300 pf or so) which resonates the loop.

I am about ready to take my test in Feburary to get my General ticket.

A friend of mine (that I have lost touch with) some time ago told me
that I could talk on 2 meter through a small wattage HT from my house
or office by purchasing a dual band mobile for my truck.

I think the transmit operation was that the HT would communicate on
440MHz and the mobile would transmit on 144Mhz to the repeater.
Receiving would be just the opposite.

Doing this was supposed to give me more "talk power" over a
conventional HT.

Can this still be done? Or with today's newer radios is it worth it
the effort.

8098. Trance-Formation of America: Epilogue

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-28 21:34:25 UTC
From: steve@trance-formation.org
Message-ID: <9A574771.454736A5@195.238.3.180>
Source record: 49805
Cross-posted to: rec.photo.technique.art,rec.radio.amateur.equipment,rec.bicycles.racing,rec.aviation.piloting

The safety and serenity of Alaska provided an atmosphere conducive to deprogramming, despite the pandemonium that ensued. Mark Phillips was the first man who not only did not abuse us, but cared for our welfare and well being. His patient, gentle manner was therapeutic, while his propensity for handling weapons and apparent intellect kept us safe against all odds. Through his noble actions, Mark taught Kelly and me that the world of human interaction in which we had existed for so long was contrary to most human behavior. We learned that goodness does exist on this Earth, and that there were those in Washington, D.C. who refused to tolerate the mind-control atrocities they witnessed us and others enduring.

As my eyes opened and I woke up to reality, I became enraged. Enraged for the traumas inflicted on my daughter. Enraged for a lifetime of abuse at the hands of our country's so called "leaders". Enraged that the American public had no idea as to who and what was/is running their country. Mark helped me refocus my rage in a productive direction when he told me, "The best revenge is total recovery."

I began recovering at the rate of 18 hours a day through intensive therapy destined to restore my memory and, ultimately, my mind. I learned the ins and outs of my own mind and recovered my memories in a journal. The stack of journals grew as over a decade of White House/ Pentagon-level abuse flooded my mind and intruded on my thoughts. Pictures from my past flashed across my mind as neuron pathways opened in my brain. I was regaining access to my own mind and control over my future by recovering my memory of my past.

Best of all, I was falling deeply in love with Mark Phillips. Why wouldn't I fall in love? He rescued my daughter and me from certain demise, restored my free will, and was helping me recover in total safety, and was the polar opposite of my abusers. He treated me with love, respect, and thoughtful consideration . Equally as important, Mark proved to be an ideal father figure to Kelly. He provided here with unconditional love and deep understanding. Through him, Kelly caught a glimpse of how kind men could be--and how good life could be. I had long since ceased to know that such a man even existed.

The love factor in my recovery is considerable. Not only did Mark Phillips save my life, but now I had a reason to live it! The love we share kept me going at times--like when Kelly was institutionalized in 1989 for homicidal/suicidal behavior. The loving relationship that Mark shared with Kelly during our short year together as a family was sufficient to arm here with the strength to survive her ensuing ordeal

as a victim of the so-called mental health and criminal justice system.

Kelly, now 15, remains a political prisoner in the custody of the State of Tennessee where she is denied qualified therapy for the MK-Ultra Project Monarch Mind-Control abuses she endured. The state of Tennessee, under the politically powerful influence of Kelly's abusers, is in violation of numerous laws and basic civil rights in their determined efforts to keep Kelly from qualified therapy and the family she loves.

While many of those in positions to make a difference in Kelly's case operate on a "Need to Know" basis rather than deliberately conspire with the bad guys, a closer look into Kelly's case history should raise serious questions in their minds. Questions like; "What could a child have to do with the so called "National Security" of our country?" The Juvenile court judge presiding over Kelly's case closed the doors to the media and onlookers for "reasons of National Security" while gross and blatant violations of laws and rights ensued.

For over three long years, Kelly and I have been denied our right to an unbiased attorney while court-appointed advocates and so-called "guardians" join forces with attorneys paid off by me pedophile father. My own court-appointed attorney, who doubles for the Juvenile Court judge when he takes a day off, has yet to represent my interest. My interest is in Kelly's well being and future-- and if she will have a future at all.

While Kelly is still amnesic with regard to most of her past, she is deliberately denied therapeutical access to her past, due to who and what she will recall. I am denied access to Kelly for fear she would be triggered into remembering by my mere presence. As for my deliberately "triggering" Kelly to remember what she was supposed to forget, as her abusers fear, it has been my experience that recovery must come from the inside out. Not from outside input. I want no less for Kelly that the piece/peace of mind I have gained through qualified rehabilitation. Which raises the questions: Why has the Juvenile court prohibited us from saying the name "George Bush?" Why is the "Wizard of Oz" a taboo subject for Kelly while the State of Tennessee provides her with Stephen King horror novels? Why are Kelly and I forbidden by the court to say the words "President," "politics," New World Order", and "mind-control"?.

In an attempt by state employees to "normalize" our relationship, Kelly and I are forbidden to discuss the past, my immediate efforts to affect her dire and desperate situation, or future plans as a family.

Most appalling and unjust in Kelly's view is the State of Tennessee's refusal to allow her any contact whatsoever with Mark Phillips. While I am hindered from having private conversations with my daughter due to court ordered supervisions and censorship, Kelly is denied the right to even wave to Mark across the parking lot. Considering that, like me,

Mark has never been named as an abuser, declared unfit, or violated any court orders, the questions must be asked: "Why does the State of Tennessee go to such lengths to ban all communication between Kelly and the man who rescued her and taught her the meaning of unconditional love?"

Kelly has asked these questions for years to no avail. The State of Tennessee refuses to even acknowledge her request for"an unbiased attorney who will represent her interests instead of those of the state". Kelly's pleas for an attorney to represent her go no farther than the deaf ears of the assigned state social worker "managing" her case. This social worker is operating on a "Need to Know" basis that has no basis, and she "Needs to Know" that she, along with the State of Tennessee, will be held accountable in the event that Kelly hurts someone or herself.

Kelly's frustrations have mounted beyond her ability to cope. I applaud Kelly for her determined but weakened efforts to stay in control of her own mind despite being denied qualified rehabilitation for the devastating results of Project Monarch Mind-Control abuses. Kelly's daily attempts to accomplish the impossible by psychoLOGICALLY managing her psychiatric disorder is proportionate to her high intellect and willful determination. But it is not enough to fend off the Psychological Warfare that has been waged against her through CIA Damage Containment practices designed to keep her contained in amnesic silence. She needs help. She needs a collective voice.

Kelly can be helped through public outcry and through abolishment of the 1947 National Security Act (and 1984 Reagan Amendment to same) that has destroyed the true security of our once great nation. You can write the State of Tennessee demanding to know why Kelly is being denied her right to qualified rehabilitation.

Thank you. - Cathy O'Brien

Every submitted comment of encouragement will be greatly appreciated!

some dual band mobile radios have the ability to act as a 144/440
repeater. Since the mobile typically runs more power and has a better
antenna than the HT, it can indeed extend the range of the HT.

Yep, that's a good idea. The funny part is (now that I checked) I
already own one of the Hosenose interfaces, with a Kenwood connector
on it. Prob'ly easy to adapt to Icom...

Thanks!
Neil

P.S. Still lookin' for the other stuff...

8102. Alliance HD73 - Need info ASAP!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-29 00:08:29 UTC
From: Scott McClements <yetbbwa@grove.iup.edu>
Message-ID: <3C2D097D.6B5F275B@grove.iup.edu>
Source record: 49806
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.space

Hopefully somebdy can help me with this one quick before I fall off my tower into a snow bank!

There was some remodeling done in my room where my rotot box was once hooked to my Alliance HD73. Problem is, the wires were removed from the control box without being marked.

So, here is the good part, I broke down, in 20 degree weather, with snow flying, wind blowing, I climbed to the 30 foot height and opened up the rotor wire cover to see what wires went where.

Here is the part I couldn't totally confirm for sure, I could only see a number "2" mark on one terminal connection.

So, here is the terminal connections as if the rotor was oriented as it were mounted in a tower and you where standing on the ground looking at it:

A 2 C
X X X

X X X
D E F

The "X"'s represent the terminal hookups. The letters represent the terminal (number) hookups in question. The "2" was the only terminal I could confirm.

So, the question is, which terminal is which number?

My rotor is the latest model, the HD-73-1, I believe its called. I found the manual online (ftp://bama.sbc.edu/downloads/alliance/hd-73/) - but it was for the HD-73. I went to the troubleshooting section and found where it tells you was resistance to look for between the wires to help straighten out which wire is which. All the resistance values checked out except the last note on the troubleshooting section where it says "Also, leads 1,3, and 6 should not show continuity to leads 2,4, or 5"

I see a some resistance between all combinations of these leads they state should show "no continuity" (open?)

Help, please!

Scott.

8103. FS: Icom IC-R7000 with Options

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-29 00:09:30 UTC
From: Fred Allen <fallen-idc@worldnet.att.net>
Message-ID: <_Q7X7.244518$3d2.12004903@bgtnsc06-news.ops.worldnet.att.net>
Source record: 49807

I have Icom IC-R7000 VHF/UHF Receiver for sale. It includes:

Icom R7000
RC-12 Remote Control
IC-CK70 DC Kit, (never used)
IC-MB12 Mobile Bracket, (never used)
Copy of the R7000 Receiver Manual

The R7000 is in excellent condition; there are few small scratches on the
RC-12 Remote Control.

A picture can be seen at:

http://home.att.net/~fallen-idc/idc/ic7.jpg

Price is $665.00, or best REASONABLE offer.

Thanks,
Fred

While this is a useful feature, there are some pitfalls.
It is advised that one link to a repeater only with the
permission of its owner or control operator. I knew
of somebody who setup his crossbander in his car so
that he could his the local repeater from his office.
Some locally generated noise on the HT side caused
his rig to be keyed up for hours. It took the local DF
guys hours to find the car (it was in a concrete parking
structure). Know these letters: CTCSS (encode AND
decode please). Don't ever leave the thing unattended.

I put ferrite beads on every lead exiting the computer case. One on all leads did the trick except that I needed 2 on the monitor cable. Move the beads along the monitor cable until the noise is gone.

It's a decent radio. There are other decent radios. Search the archives of
this group to read plenty about why you should buy whatever radio somebody else
bought.

On the other hand, a more productive use of your time might be to read whatever
reviews are out there, particularly the ones in Passport to World Band Radio,
World Radio and TV handbook, and on the web at:

http://www.rnw.nl/realradio/rx_index.html

and

http://www.dxing.com/rx.htm

Just remember, everybody has an axe to grind.

Thank you Ralph, I personally agree with your statement of the situation.
However, there are others within this group that appears to disagree.

As far as your analogy of gun usage. Well, a person may very well be legally
justified to shoot someone for stealing/ fear_of_life and be let go by the
judge, but then the victims family may sue you for wrongful death or
something else. Either way, you will/may go through a horrible ordeal
before it is all over and done with.

FCC Rules Part 97 Amateur Radio Service is what you are referring to. Key words *AMATEUR RADIO SERVICE* in the title. nothing mentioned about commercial or PS frequencies or service. Nothing mentioned about modifying a radio either. Part 97 deals entirely within the Amaterur Radio Service. Amateur Radio has specific frequency allocations. Commercial/PS have their own frequency allocations. Apples/Oranges here folks.

After ten plus years dealing with govermental regulator/enforcement agencies dealing with safety/health/enviromental compliances, I've become very aware on how they think. Very black/white and zippo gray area judgements. They go strictly by their little book. For instance, You can not mix Amateur Radio Service policy/procedure/regulatory rules with Commercial Radio Service policies/procedures/regulatory rules. Period. If they (regulatory agency) mixes apples and oranges from even within their set of rules, then you have a case for the appeals judge to throw out the penalty/fine.

As another poster mentioned. you can do as you want to in time of emergency.

Hi All;
I have for Sale an Icom IC-2KL solid state amplifier with matching Icom Powewr supply.
Covers 160 to 12 meters, tested 500 watts output on CW, only needs about 30 watts depending on the band.
Can automatically interface with a few Icom rigs like the IC-720 thru IC-745.
If not, it will work with any rig that has a normally open relay that shorts during xmit. This will key the amp in xmit mode.
All in Very nice condition.
Price is $1299.99 shipped Conus!
Thanks es 73..........RICH-WA2RQY RLUCCH2098@aol.com

The $149-or-so range will usually result in a mediocre radio for sw use. Try to double or triple that dollar figure. And look for a good indoor-or-outdoor amplified antenna, or an outdoor wire antenna. Check the reviews in Passport to World Band Radio, for starters. It's in most big book stores, as well as the swl stores.

Have fun...

Bob

: And cops don't understand that they can't radar your speed under 500 feet from the speed
: limit sign where the new speed is first posted, that is why you go to court and have the
: judge dismiss your ticket and you laugh at the stupid cop for not knowing the law.

Of course the cop is laughing at you because he dragged you out of a
job into court so he could get a day off the street with pay.

: Perhaps a more realistic view is that someone under your care would die, and under my
care
: would get quick medical attention. You would be breaking another law by not getting help
: when you had the radio and ability to do so. You would most likely get sued. And it would
: actually be because you were an idiot! You might also lose your ham license (if you bozos
: even have any) for not knowing the rules and regulations that you are required to.
:
: Your 42 years old, you should know better.

You didn't state your age and I didn't give mine, but perhaps
you have issues with your father. I hope you aren't threatening
my family.

If you are prone to flying off the handle under minimal stress,
maybe you should get help to explore yourself rather than trying
to save the world. You could just as easily deprive any one under
your care by jumping into something without really understanding it.

I will repeat myself as you seem to have trouble looking beyond the
first paragraph:

"but even with a bushel basket of Public
Safety frequencies in my hat, I still would get an emergency
message out more efficiently to the local ARES/RACES repeater
operator on duty who would then route the traffic properly while
my hands are full."

primarily because the large areas of my travels takes me through
numerous jurisdictions, many of which use encrypted or digital
dispatching. The "local" ARES/RACES system covers
several counties. Also I have combat first-aid training.

galaxydoctor@aol.com (GALAXY DOCTOR) wrote:

>i am looking for a 2 BIRD Meter movement.working.for model 43

Just an FYI - that meter movement is still available from Bird. Below is the part number:

8-000 Meter Kit (includes meter, cable w/ connector)

It is a special 3 1/2" 30 microamp (1400 ohm) movement meter which is made for them by Hickok (or at least Hickok used to make that meter for Bird - they may be sourcing it from someone else these days).

Unfortunately, their web site catalog does not include prices, but you can call them at (440) 248-1200 for pricing and to order the meter. They are located in Solon, OH (just outside Cleveland), so they are in the Eastern time zone.

Regards,
Bill Bowen
bowenb@best.com
Daly City, CA

P.S. Bird's web site is www.bird-electronic.com I should note that their web site does NOT work correctly with Netscape (the menu buttons on the left side of the main frame don't work). It does work correctly with IE.

Of course each situation would be unique.

The Second Amendment states:

"A well regulated Militia, being necessary to the security
of a free State, the right of the people to keep and bear
Arms, shall not be infringed."

Of course you can be in complete denial over the meaning and
pick at individual words rather than taking the sentence as
complete. Essentially it says that it is an obligation of the citizens
to train in defense of freedom, and that they must not
be prevented from having the means to do so. Still, how many
people ARE prevented, arrested, perhaps even shot for merely
having a weapon in possesion?

Still the same argument about even legally modified radios
would apply because the weapon would be used for
defense of ones life and property or the life and property of
another by most anyone who whould bother to go into a
gun store and submit to all of the background checks, taxes
and having all this information leaked to unauthorized
persons and maintained on illegal databases, while the killer
or robber would just go out and steal a gun from a cop and
ignore a million laws. A recent case (about 3 years ago)
where someone in the mountains called in a rescue hellecopter
with a modified ham HT by calling in on a Fire frequency.
He saved his buddy's life but got his HT taken away by the
FCC. (True story). It depends on where you are and who
you are dealing with. The bottom line is that if you intend on
doing a good deed, you better not get caught!

I want to thank all of you that sent email to me this past week with the loads of great information and help regarding the antenna, installation and legal use of this Kenwood radio. I have since picked up the novice-technician study guide and have located a local testing group, where I will attempt my first test next week! I now understand that it's more of a base station rather than for use in my truck, that I will need to use a battery with a charger. The base antenna and coax information you've directed me to has been very helpful; I plan on using one of my pine trees as a tower before spending too much of my paycheck. I am really excited!
Thanks again,
-Dusty Red in Dixie

Golly! 3 to 5 watts seems like QRP, but 80 to 100 watts? That's QRO!

Just happen to have one on the bench that I want to sell. All cleaned and
re-greased. Below is the wiring:

1-2-3
4-5-6
No need to fall off the tower :-)

> any damage to yours attributed to the cold alone is likely due to
> moisture.

I have had LCD equipped transceivers permanently installed in my
vehicles pretty much since LCD became popular. I have also left LCD
equipped HTs in the car overnight during the winter. The ONLY indication
of any effect has been on especially cold mornings when I have put a
transceiver in scan mode while the inside temperature was still -20C or
lower; the display is noticeably slow until it warms up a little.

I'm pretty sure a lot of automotive radio and sound systems up here in
the "cold white north" also have LCD displays.

On the other side - heat.
The only problem I have had is with a receiver sitting with direct
sunlight on the display in midsummer. The LCD display has gone
completely black, but recovered in short order when turned away from the
direct sunlight.

Hi Folks,
I've got a Jeep and a Yaesu VX-5R HT and am considering installing an IC-2100H, 2m xcvr in my Jeep. I've never used auto-repeat or crossband repeat functions so give me a little advice:
The IC-2100H advertises "auto-repeater" as well as CTCSS Encode/Decode. I should be able to use the VX-5R <=> IC-2100H (using CTCSS to prevent deadkeying on the repeater) and then auto-repeat in-band <=> repeater, correct? That will extend my HT xmit range to the repeater but can I have extended xmit & rcv via the 2100H?
At first glance, it doesn't appear that I can have it both ways. Or can I?
I won't buy a more expensive or more delicate xcvr for the Jeep for reasons of WX, installation challenges and theft (I already have ideas of how to seal/secure the 2m in the vehicle). Right now, I'm just concerned on a simple yet effective system setup.
Drink, WP3JQ

>considering the Grundig YB 400. Does anyone have any comments, good or bad,
>to make?

I have one. It is a good radio. Some comments, as requested:

- Refurbished models are commonly available at much lower prices than
new. If you decide on a refurbished unit make sure you buy from a
reputable dealer, as these sometimes have problems (as did mine).

- This radio benefits greatly from an external antenna. Don't bother
with an expensive antenna - 5 or 10 meters of ordinary solid wire
works wonders.

- The radio is slightly top-heavy and tends to fall over easily,
especially with the antenna extended.

- If you will often be using battery power, invest in a set of
rechargeable NiMH batteries - not NiCad. Rechargeable NiCads don't
last long in this radio.

HEy Drink, I am having trouble figuring out what you are asking. No, it's not your fault, I'm just a little slow. Give me/us an situation to go along with your question.

As for cross band repeat. I usually set my mobile on simplex on the input to the repeater, and use my dual band to monitor the output on the repeater. this way my mobile doesn't tx evertyhing that comes through the repeater.

mobile set to 447,85 simplex pl 136.5
th77a vhf 147.555 pl 136.6 uhf 442.85
I transmit on the vhf side on the th77a

I found this works great, doesn't heat up my mobile and best of all my mobile battery doesn't die.

The Auto repeater function is Icom's name for automatic offset
direction setting when you are tuned in the repeater sub bands. The
IC-2100H does not operate as any sort of repeater.

The only current products in a mobile or base station Icom makes that
operate as a cross band repeater are the IC-2800H and IC-910.

I was a little confused by this post at first, but I think I may
understand what your question is and also what the confusion is all about.
First, I think you want to use the IC-2100 to cross band repeat,
however, this is a 2 meter rig and won't receive the 440 MHz band. You may
have read that it has a feature that allows it to automatically adjust the
radio for "typical" repeater offsets. That feature allows you to type in a
frequency and radio to recognize that it is in the repeater sections and
adjust the offset for you and all you have to do is transmit.
If this isn't what you had in mind, let us know and give us a little
more information, so that we can help.

Okay, these are the particular functions that interest me in the
IC-2100H, 2m mobile (exactly as they appear on the ICOM website:

Built to Military Specifications (MIL STD) 810 C/D/E for Shock and Vibration
CTCSS Tone Encode/Decode Built-In (program up to 50 tones)
Auto Repeater with Busy Lockout

I've done my homework regarding preliminary comparison and both private &
commercial reviews. What I want is the integration of my VX-5R (very good
tri-bander) with the IC-2100H (very good monobander) to get into distant
repeaters.
In the advertisement, "auto-repeater" tells me it'll auto-repeat from/to
the 2m band vice Automatic Repeater Shift (ARS) or auto-offset.
If I understand this correctly, will the IC-2100H do what I'm asking or do
I have to go to a dual-bander w/cross-band repeater? The IC-2100H should
extend the range of the VX-5R by re-xmitting the HT's signal, correct? But,
would I have to rely on the HT's receive to hear the repeater or could
something be done with the mobile to make this setup duplex? I know the
dual-bander would be a fully integratable solution, but, what's currently on
the market is a lot more expensive and doesn't suit me for durability in a
tank-like 4X4. Does that make more sense?

Okay, there it is! Thanks Gary. "Autorepeater = automatic repeater
offset in ICOMese". Oh well, I've seen good things about the IC-2100H and
will probably get one for the Jeep. I can put a nice dualbander in the
XYL's nice sedan.
Incidentally folks, I've never had problems with upgrades to the
familymobile when I use the "Surprise Honey! Look what I did!" method:)
Are there any good single band mobiles that repeat & CTCSS enc/dec?

What is referred to as 'auto-repeater' means it will (if set)
automatically determine the repeater input frequency if you program the
repeater output.
You'll need full crossband repeat, with a crossband handheld to do what
you wish.

Good evening to all the Kenwood TM-V7A owners,
I'm snooping around for a good mobile since my HT just can't quite hit the repeaters in my area. I went to eHam.net to check out the user reviews and was shocked to see that a xcvr like this hasn't received any reviews! Could anybody who has practical experience with this dual band take a minute or two to give a review and post personal afterthoughts and considerations *please*. Reviews can be posted at the following site:

Screw it in with phillips-head screws that don't have a hex head, then
drill the screws' slots out smooth. It'll stop the average crook, but
you and your drill can get it out fairly quickly if you need to.

Not too sure the wrongful death suit would fly in NC. By ruling that the shooting/killing was
justified, the allegation of "wrongful" becomes hard to support. If you shoot someone who
has entered your home (often called 'home invasion' here) at night, it is quite obvious that
the perp has ill intent towards you and your family. His very presence in your home is cause
for you to act to protect life and limb. Not too long ago, a guy attempted to rob a store owner
here in my town. Broad daylight, too! He didn't figure on the storekeeper packin', and at a
moment of inattention (watching the money being placed in bag), the storekeep suddenly drew
his .44 and blew the guy up against the door, sending the robber's Sat'dy night special flying.
Cops investigated and exonerated the storekeeper. As far as I am concerned, the "victim" got
exactly what he deserved. And, there ought to be even more of these scumbags getting sent
into the nether regions instead of the taxpayers footong the bill for his/her 3 meals, a bed, cable
TV, and a law library for the lowlife to try to outwit the law and do his crimes again! Talking to
a local cop friend of mine, the unspoken opinion of the cops on the beat is that the more of them get blown away by private citizens, the easier their job is. Chances are, the cops know the perp already, and they are just as ready to be rid of these pieces of trash as the REAL victims are!

You are right that killing someone is not easy--even if they deserve it, and one has to live with that fact forever.

Jerry

Drink,

You need the Kenwood TM-V7A which does "locked band repeat" as well as
"x-band repeat". This is one fine radio and will do exactly what you need.

Drop a line if you need more info.

My biggest problem's moisture. I don't have doors or windows. And, the
only top I have is a bikini top. I need a good idea for an enclosure
because, even under the dash all the way up to the firewall, It'll be damp
or soaked in a strong storm.

Iam thinking about setting up a web cam or some kind of wireless camera on a local mountain top . Does anyone know where I can get the info on how to do this or does anyone have any ideas for me ! I haven't put a lot of thinking on how to do this yet , just getting started . I know I can get the permission to access the mountain top . There is several towers atop the mountain (cell phone, ham repeater other radio repeaters, local radio station just to mention a few) . Thanks for any input 1 73's, Sam KG4HEB kg4heb@psknet.com

BS. It's an emergency with a disabled cop. I can do whatever I damn well please. Being his radio is certified, and mine is not, and his is going straight to the PD dispatcher, and mine is not, I'll use his, thank you very much.

>
> Would you not use the radio if it was the only method of commutation?

Duh, no , I'd just stand there with my thumb up my bum. But what does this have to do with what I said? I never said it was illegal to use any radio in an emergency.

> Believe it or not, most courts allow for common sense. If some moronic

You read the frigging rules. I already have. And if you can quote me saying anything about the fcc rules that is untrue, I'd be real glad if you would let me know about it. MK

Hi Drink,

I believe you have misunderstood the term auto repeater. This means that if you enter a freq. via the vfo the radio will automatically shift + or - to the offset of .600 or what ever you have set for the offset. Most repeater in the US are .600Mhz.

The radio does not have crossband repeat. I have the 2100 and in order for a radio to do crossband it must have 2 vfo's.

Hope this helps, you made a good choice in the 2100 they are nice radio's.

> radio that doesn't belong on that freq. and calls in a less than emergency
> situation. What would you do with them?

The same thing that you would do to an unlicensed person using a NON modified ham radio.

The same thing you would do to a licensed ham on a NON modified ham radio using approved frequencies to make a false distress call.

What does inappropriate or illegal actions have to do with what frequencies a radio is capable of transmitting on? Don't twist the subject 180 degrees to try to make some ridiculous point because you can't make one by sticking to the subject and situation at hand.

> Heck, take it a step further. Why have a Ham licensing program at all?

Completely different subject again, but at least change the subject header if you are going to change the subject.

> Allow whoever to own/operate a Ham radio or modified radio to call in
> emergencies.

Again, I'm sure this is also not a problem if it saves a life. Only YOU would seek to fine or jail the person who used a ham radio without a license to save someone's life. That is VERY VERY sad.

What part of "ANY means" do you not understand? Using a modified radio would surely be included in the wording: "ANY means" The ham tests must really be easy now if you passed one.

Yes, I can just see that bozo telling a cop that he disagrees with the cop's interpretation of speeding or shoplifting. It is clearly stated, and there is nothing to interpret, just take it literally as it is written.

Else we could all just "interpret" that the rules allowing you to use a repeater actually mean you can not use one and you are breaking the law every time you do.

Stop "interpreting" the rules, and start following them. Rules are not "opinions", they are facts.

How stupid! You could do the exact same thing on a ham frequency on a NON modified radio! You listen to the frequency first and determine if any communications are taking place, and don't key up when someone else is talking or no one will hear you anyway. As soon as the officer on the air unkeys his radio to call in his ticket for someone going 10 miles over the 25 MPH speed limit, you can break in with your emergency call just as you would on a licensed frequency. Or is it ok for you to break in and interrupt other emergency communications on the ham bands that you find this necessary to point out for other bands and frequencies?

> was to approach the issue with the local police (police chief or rep who
> has the authority to make policy). If I'm not misinterpreting, I think it's
> a good point.

You are a moron. I don't care WHAT anyone's policy is, I will do what the FCC rules say I CAN do, and the judge can tell the police chief to get laid a month AFTER a life was saved by me, while the chief was eating donuts or giving someone a ticket for not wearing a seat belt. LOL!

There isn't a whole lot to say about the TM-V7A.
I have two of them, or did.

It's handy and works both the 144 and 440 bands although not at the same time. You can cross band...I.E...Transmit on one band and receive on the other. The display only shows one frequency/band at a time, but it does switch with transmit and receive.

It's easy to program whether manually, or by computer with the accessory cable and free downloadable program from Kenwood.

They aren't as rugged as the older rigs, but then I don't know of any HTs that are any where near as rugged as the older ones. The antenna could also be a bit longer as I find it to be marginal into the repeater from about 6 miles, but I am shooting through trees and buildings.

I had the rubber cover come off the PTT switch on one while wearing a back pack, two cameras, and a cell phone. One of the camera straps slid over the HT and pulled the PTT cover right out. Admittedly that is a bit more than most would get, but I'd not expect the cover to pull off so easily.

One didn't do a very good job of surviving the fall from my climbing belt when I was at the top of the tower. The HT landed in the grass and on the antenna no less, but it blew the battery pack off, the display cover split, and in general made a mess out of the case and split the battery pack. As far as the circuit board the only problem I found was the connector for the PTT switch broke off.

Of course, that is after falling a good hundred feet, so all things considered, I really didn't expect to find an unscratched HT when I got down there, even if the ground was soft.

I think they are a pretty decent value for the money.

I really hate to "rain" on your parade there Roger...but the TM-V7A is (and always has) been a dual band MOBILE transceiver.You state you have/had two of them..you SHOULD know what your talking about....but dont. Electrically speaking it's very closely related to the TM-G707A dual band mobile, the main differance is the V7 can do both bands at the same time. If one band at a time is OK with you (Mr.Drink) I highly recommend the TM-G707A ($299) as it has a great RCVR,nice power out,can be remoted,nice display and good transmit audio

Best bet there would probably be some sort of waterproof box that
opens at one end. Run the cables out the other end , silicone the
holes, and remember to put the lid back on whenever you leave it.

Huh? Every V7A that I have ever seen (including my own)
is a true dual-bander that displays VHF and UHF simultaneously.
Perhaps they are different in other countries, I am in the USA...

Point being, *if* it is legal to place a call on a non-certified
radio/frequency (* your* belief, in times of an emergency, whatever
definition that maybe) that you do not have authority to operate/own or use,
then it would be OK (by your thinking) for a non Ham to carrry and use any
sort of radio so long as they only used it for emergency communication.
BULL!. Using an injured cops certified radio is a different issue
and highly unlikely to ever occur, but possible..

>

You think any radio transmission is not a problem, so long as it saves a life? You are crazy. Show us your medical training that allows you to make/assess life/death decisions and direct approperiate medical treatment? Thinking that it is perfectly LEGAL to use/own/operate/carry/modify whatever a person wants so long as he *thinks* (in his untrained eye) he may someday respond to a serious accident. In the mean time, he is in possession of illegal devices. For this subject, a modified Ham radio. You have taken one line out of Part 97 "Ameteur Radio Service" and have tried to justify all your actions. KEY WORDS = Ameteur Radio Service Go ahead, in your community, with your judgement, it very well may work and you get away with it. Try it someplace else and you/someone_else may/will get the snot slapped out of you. Read into this legal actions against you.

If you are willing to do an *illegal* act in the attempt to do a very honorable deed and willing to take the personal consequences, then so be it. That has been my point all along. Does the person know if what he is doing modifying a Ham Radio) or using (mod Ham radio) is legal/illegal. There are good-samaritan laws on the books to legally protect people trying to assist injuried person(s), but there are even limits attached to what you can/cannot do.

Okay Ms. Hoonie,
I'm not stupid and I'm not a moron. I agreed with you while I understood the gentleman's point which I think you missed in a stubborn, rude, argumentative rage. I understand Part 97 and know what it does & doesn't say and intend to follow the spirit and intent of the law. I'm no lawyer but I am a professionally qualified emergency communicator in the Defense Dept to the highest levels of the Federal gov't. There are many other old hams here that are imminently more qualified than me, but, they don't respond to you because, being wiser, they anticipated your argument turning to extreme, narrow examples and abusive treatment :("stupid", "idiot", "moron", "liar", etc.) I don't see anything stupid about discussing emergency communications with emergency management officials. I don't see anything moronic about learning from a disaster preparedness book or elmers or seeking out more formalized training from activities like ARES, RACES, SKYWARN, etc. I wonder, are you a member of any organization? Have you any experience or training in emergency communications? Or did you just mod your radio planning to call EMS dispatch to rescue you and yours even though you disrespect them because you think their most noteworthy achievement is eating doughnuts? Personally, I love doughnuts, but, I'll take the time to grease the skids for an emergency.
It's unfortunate that I've become the object of your aggression in this string of unhappy men you leave in your wake. But, a man must stand up for himself in the face of abusive insults.
I apologize to the others in the NG for the inconvenience. I don't suspect Ms. Hoonie will argue here much longer.
Respectfully,
Drink, WP3JQ

Source record: 49704

Hello group
The high tension powersupply for my old Hallicrfter tx needs new filter capacitors, several different,
all 400-450 V, 8 , 16 myF , the ones I can buy today are much smaller, say 70 % length and dia.
As there always is some leakage and thus power that needs dissipation are they so much better
leakage -wise e.t.c that I can use them same voltage es myF, or should parallell them?
Do U have any experiences?
tnx in advance and seasons greetings / per /sm7aha

8200. Antenna MADE for AO-40

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-30 14:24:04 UTC
From: Glenn Rollins <glenn@n3iyr.com>
Message-ID: <fo8u2ukg18u0mnc6j7pe0u9chqeh52n93c@4ax.com>
Source record: 49706

I have a website for the product I have developed and am now offering
in the Amateur community. Please drop by and look around.
This antenna is made especially for AO-40.
It's about time. Hu? It is NOT a BBQ grill trying to be something
else. This is the real thing. Please leave me a comment and tell me
what you think if you like.

http://www.n3iyr.com

Thanks!

Thank you for taking the 'high' road in your answer!
People need to realize that the discussion of topics is what a NG is for,
not to flame and put down our fellow amateur operators. Even it we
happen to think their opinion is stupid, it still is their opinion and they
are entitled to it. But those expressing an opinion have to remember
it's not a fact chiseled in stone it's just an opinion, and not beat everyone
over the head with it. That's MY opinion. ;)

<snip>

The AR8200 is made by AOR, but it's a DC-daylight radio, so it's not
your best choice if you're just interested in SW.

Thanks Gary & Joe,
autorepeat=ARS. Yep, I've been using this Yaesu too long:) As for
moisture, I'm thinking a shock mounted radio in a surplus ammo case with a
lip seal unless Tuffy sells a decent overhead enclosure or homebrew it
myself.
Thanks Guys.

I wouldn't bother with replying to Sarah. For one, "she" doesn't ever identify herself. Secondly, we don't know "her" involvement in amateur radio and what experience they have. Thirdly, "she" is using an anonymous address.
All "she" has done since she started responding in here, is to throw flames at everyone. There has been no intelligent discussion from her point and she has only stated what has already been covered.
Besides that, I think we have found that there are two camps with two opinions on this subject and that we aren't going to ever solve it here. It is like I said in my first post on the subject, we are going to open a "can of worms."

8205. Atlas 210 system for sale

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-30 15:16:08 UTC
From: Frank Krozel <frank@electronicinstrument.com>
Message-ID: <a0n406$28n$1@nntp9.atl.mindspring.net>
Source record: 49699

Hi all:
Extra to my needs, very clean Atlas 210.
This system comes complete!
Aligned, updated about a year ago, new pieces etc to make it look real good.
Comes with the slide in base power supply with a built in speaker
Also, the microphone (hand mic) as well. Yes, original manual is
included.
80-10 meters
Last, I do have the slide - in mobile mounting bracket.
I will sell for $250 plus shipping.
This radio has been stored since it was updated!

In your post you stated that it is a licensed service there fore would be
legal. My point is that it would not be legal for you to use it as you are
not a member of the licensed organization. If you are concerned with legal
technicalities that is the issue here.

hi i just listed a hw16 on the eham site, i have a hw16 thats very clean
although some of the lettering is worn off the back side, it works quite
well and i have used it for qso's on 40 meters. only thing i can see
thats different from stock is someone replaced a couple of sections of
the multicap in the power supply by adding a couple of capacitors across
the orginal. asking $85 plus shipping

Hi Karl,
Darn! I was kind of hoping that I could slink away from the animal that this has become:) It sure has generated a lot of discussion and good ideas and I understand why many alter their radios. The question was apparently worth talking about. It also brought out a few reasons that I don't think are valid. But, at least they're in the sunlight of scrutiny. It would be worse to be ignorant but bliss sounds pretty good right now.
It's unfortunate that it also DEgenerated into "interpersonal challenges of vertical urination". I really hate it when we show that, despite our technical ability, many of us don't put enough effort into the Arts of communication like clearly articulating our thoughts, conflict resolution and simple diplomacy. (The question is an extremely powerful tool). A verbal argument, to me as a Ham, is like a punch in the mouth at the park. One really doesn't want to walk in that park any more:)
BTW, I originally cross-posted this because it did affect a couple of different NG's. At this point, however, we should narrow the posting to the NG affected and at least start re-titling the subject so I can get out from under this thread:) (Examples might include: "Re: Shut up" or "Re: I'm not a ham but I play one on TV" or "Re: Re: Re: OT: My Yugo stalled after installing NMO antenna") Hihi!
Best Regards,
Drink, WP3JQ

Well my fellow Hams,
Most of you seem to be lost at sea without a radio (nor a clue). The FCC's Part 97 has no prohibitions on modifying Amateur Radio Equipement. So, that's the end of that little tit for tat.

Now on to the main discussion, Is it illegal to transmit out of band? Yes, except for the provision set forth in FCC Part 97.403 that I will not quote because as a Amateur Radio Operator licensed by the FCC, you are required to know Part 97. What is meant by a life treating emergency? As a former Firefighter trained in emergency medicine, a life threating emergency is one that if the victim does not have medical attention within the first hour (AKA the golden hour) there is very little or no hope of survival. A broken arm would not be a life threating injury whereas an open chest wound would be. The protection of property issue is a little murcky. If I saw someone breaking in to a house or store I wouldn't deem that serious enough that getting on to a Public Safety frequency for the call. However, an armed robbery or hostage situation would warrant it.

Now, something I haven't seen anyone bring up is that what frequency would you use? See, that's where the emergency issue comes to play. If you're somewhere that's not native to you, such as you are from New Jersey and hiking in Washington State and you or someone in your party suffers that life threating injury you could at least tune into the Public Safety Band and listen for activity.

The bottom line is that you must exaust ALL other possibilties of communications before you transmit on any frequency outside of our bands. Chances are, if you have done your homework you'll know the local repeaters because you've probably already made a few contacts.

Please seriously think about what action you would take before you need to act. During the emergency is not the time to plan.

Unless you can show a specific code section making it illegal for a "to
carrry and use any sort of radio so long as they only used it for
emergency communication", it is in fact legal. At least in California, where
all law is statuatory.

<snip>

> against you.

You do not need medical training, the reasonable man concept would apply.
A guy takes and passes his Tech test. He buys a new radio and goes home. He
walks into his house and finds his wife laying unconsious in a pool of blood
and yells for help on his new ham radio. He may well assume it to be an
emergency and the results of any (unlikely) action taken would find in his

favor, even if it was not an emergency.
If I did *exactly* the same thing, they might well take my license before I got it.

Why. Because the "pool" of blood came from a minor scalp wound and was no big deal and the woman was not really uncounsious she was faking it and tha came about because of post partum blues.
And I've been in EMS for a very long time and am very well trained.

That is the reasonable man concept and is exactly what invalidates most of your argument.
Again, unless you can show it is in fact illegal to carry an "illegal" radio there is no crime and civil action is very unlikely.

Many police departments lament the fact that it is not illegal to listen to what they say over the air, but their only recourse was to scramble.

In the early days, descrambling was very easy, and in fact most of the cops around here learned to understand the scrambled conversations.

Hi Jeff,
I was thinking exactly that (Pt 97 not prohibiting these types of mods).
The FCC did, intentionally I'm sure, leave this hole so as to foster
experimentation and many other activities. There's also a big difference
between the radio services and their regulation, etc., etc. Your
professional experience puts you and others like you in the right frame of
mind. To me, it seems pretty simple: focus on what's right, do what's right
and use your judgment to know the difference.

Does anyone know how to adjust the level of the DPL on a FT-100D? I am looking for the adjustment pot if there is one or software adjustment. Mine is much to high. Thanks Please respond to Steve@wa4bzu.com

8233. FS: MFJ-949E Tuner good cond.

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-30 22:08:34 UTC
From: Mountain-Ops <rich@Mountain-Ops.com>
Message-ID: <3c2f7dd1_3@news.newzpig.com>
Source record: 49735
Cross-posted to: alt.ham-radio.marketplace,rec.radio.amateur.equipment,rec.radio.swap

MFJ-949E used, good cond. please read about the model below.
Can email a photo upon request. Orig manual included.
$105.00 OBO shipped in the lower 48 states.

Full 1.8-30MHz Operation
Custom designed inductor switch, 1000 volt tuning capacitors, Teflon
insulation washers and proper L/C ratio gives you arc-free no worries
operation with up to 300 Watts 1.8 to 30 MHz.

Tunes any Antenna
Tunes out SWR on dipoles, verticals, inverted vees, random wires, beams,
mobile whips, shortwave receiving antennas.... Nearly anything! Use coax,
random wire or balanced lines. Has heavy duty 4:1 balun.

Custom Inductor Switch
The inductor switch is the most likely component to burn up in any antenna
tuner. MFJ's inductor switch in the MFJ-949E was custom designed to
withstand the extremely high RF voltages and currents that are devloped in
your tuner.

8 Position Super Antenna Switch
Lets you select two coax fed antennas, random wire/balanced line or built-in
dummy load through your MFJ-949E or direct to your transceiver.

More hams use MFJ_949s than any other antenna tuner in the world!
Has MFJ's full size 3 inch lighted Cross Needle Meter (not a puny "meter"
you can't read). Lets you easily read SWR, true peak forward and average
reflected power simultaneously on 300 Watt or 30 Watt ranges. Lamp has
on/off switch, requires 12 VDC or 110 VAC with MFJ-1312B, $14.95

QRM-Free PreTune
MFJ's QRM-Free PreTune lets you pre-tune your MFJ-949E off-the-air into it's
built-in dummy load! Makes tuning your actual antenna faster and easier.

Plus much more!
Full size built-in non-inductive 50 Ohm dummy load, scratch-proof Lexan
multi-colored front panel, superior cabinet and construction and more!

Hi:

I have some Brand New Motorola Syntor X9000 Program Cables.

These are some of the best I have seen, and are made better
than what Motorola supplies. Has " heavy duty" Cable supports
@ Both the T-Shell, and DB25F

As in the photo:

http://www2.4dcomm.com/metrotech/x9000_c.jpg

Has all the contacts for Options & other models too:

110.00ea+8.00 for Pirority Mail Shipping & Handling

PayPal Now Accepted !!

Acceptable PrePayment in the form of a Postal Money Order, PayPal (If
immediate shipping is desired) or a Personal / Business check is A-OK too if
you do not mind a Short Shipping Delay due to bank processing time. This is
required only the first time or two as once you are in the data base,
PrePayment is no longer required

Monty

Hello,

HT600 VHF 6 chnl radio
I couldn't get this radio to power up, but don't have time to troubleshoot
it. Let my loss for time be your gain.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1316432492

Low start price.

BINGO, and this is the key to half of the controversy. I don't believe that anyone here is taking the position or criticising anyone for advocating the use of EM freqs to report a genuine life-threatening situation, but only suggesting that people use a little common sense (which I understand is extremely difficult for some of you) and exhaust all other legitimate amateur alternatives at your disposal before you attempt to play GI cop and transmit on any emergency frequency with your modified toys in order to impress your friends..

The other half is that some of you seem to think that it's okay to use a non-type accepted amateur radio to make "licensed" transmissions on public safety or commercial frequencies, which it is in fact not. If you're a cop, fireman or licensed EM, is it that inconvenient to carry a second issue HT along with you, or if you have a legit business does a second commercial HT cost that much more that you can't afford to purchase one?

I am a licensed ham as well, and I bought a Yaesu FTC-1143 UHF commercial HT in order to use at a business which I do contract work at. If I can do it, then why is it that you stubborn hardheads insist that you're gonna use your modified amateur HT's whether anyone likes it or not? It's not necessarily what you do, but rather the haughty and pompous anarchist attitudes that go with it that I object to..

And I *don't* like smartasses..

Hi,

I noticed ICOM transceiver adopted LCD as main display unit. How long does this last? I don't want a blind transceiver in several years.

I am trying to use my FT101EE for PSK 31, every time I cycle between tx and rx the frequency jumps a 100 hz or so with each change over. There is no discernable drifting in either tx or rx just the jump in frequncy qhen cycling between tx and rx. Any ideas on what would cause this?
Thanks
N7BYD

I agree with you, Joe. "Exhausting all alternatives" is key and hasn't gotten ample coverage because it's absolutely vague ("exhaust" that is). We know what it means but nobody's really talked about it. Let me try: 1) first repeater, no answer for how long? 2) 2nd rptr, no answer for how long? 3) Attempt to call a 3rd rptr maybe? 4) calling freq, no answer for how long?
The problem doesn't enter with the extreme examples that abound (hanging on to the severed aorta of a highway patrolman). The problem comes in more plausible cases like a auto accident when most of us would be pressed to know how to handle it (i.e. kid's bleeding a lot but it's in an extremity and he's conscious). The commensurate amount of effort to get through ham channels is probably gonna be inversely proportional to the situation. If the only thing I can gurgle is, "Help me at 123 Vine St <gasp...>" I might be inclined to do so to any EMS dispatch I knew (don't know any, honestly). I haven't had the opportunity to get training for ARES or the like but have wanted to for a long time. I wonder, what do the numbers look like for EmComm training or ARES participation?

Hi Bob,

Which ones are you looking for ??? I have a couple of the later ones
(the -1's) that I could scan and E-mail you. They don't say much--there are no
installation instructions on the sheets, only specs. The installation
instructions are in the radio owner's manuals.

Yes it is a can of worms. I have seen this crap from a few Commercial/ Public Safety and unlicensed bunch that just want to use a random frequency out of the hat or a cheap radio. The Emergency argument is usually bogus because they would be farting around trying to figure out what frequency to use, when they are told to go to "tac 10" or the radio would be broken from rough usage. Often I see that Emergency planners are in over their heads on channel plans, as the man in the field only uses 1-4 channels out of 40 or 50 (or more) and the crew really needs to concentrate on other things besides being a radio operator. But there are those who see the Hams have something and they want it! And they want to get away with it! They just don't understand that their equipment needs and training are specifically different for a number of reasons.

The FCC rules are also specific that ham radio not be used for regular business- That means regular Police, Fire, Search-Rescue or commercial business, because their radio needs are different from hams. This is also why whenever hams have supported the public, the radio stays with the licensed ham (they are a team) and it is for events and situations that are so extraordinary as to be outside of the normal communications planning.

> I wouldn't bother with replying to Sarah. For one, "she" doesn't ever
> identify herself.

You mean, by that, that I don't plaster my picture, life history, phone numbers, and addresses all over the internet like you do. Here are pictures of this asshole, where he and his fianci¿½ work, pictures of his cats, and whatever the hell else you want to know about him, probably his SS number too. http://www.angelfire.com/ny2/guypd/index2.html

I don't need to do the idiotic thing you did in order to make a statement on a newsgroup. Nor do facts require that you know the hair color, birthdate, or home address of the person stating them.

Only a complete idiot puts his life story on the internet, then picks a fight with someone on a newsgroup like you just did! I can't believe how stupid you are.

> Secondly, we don't know "her" involvement in amateur
> radio and what experience they have.

Not important, or relevant in stating facts and quoting Part 97 rules. When you read them on the FCC website, you don't know the name, age, or home address of the FCC employee that posted it there either, do you. Of course not.

> Thirdly, "she" is using an anonymous
> address.

As do all intelligent people when posting to the internet. How interesting that you even KNOW that it is anonymous! You obviously tried to send me email or something and that is exactly why I can no longer list my correct info, because of assholes like you. The fact that you were able to make the statement that my address is anonymous, shows WHY it is anonymous. What a moron!

> All "she" has done since she started responding in here, is to throw
> flames at everyone.

You are the only ass on the planet that considers Part 97 rules a flame! ROTFL!

> There has been no intelligent discussion from her point

Take that up with the FCC! They are the ones who made the rules, I just relayed the info from them!

> and she has only stated what has already been covered.

And you have only discussed your obsession with my personal information and email addresses, nothing relevant to the discussion at hand. This post of yours is nothing but what you are accusing ME of? LOL! You don't see that do you? GOD are you stupid!

> Besides that, I think we have found that there are two camps with two
> opinions on this subject and that we aren't going to ever solve it here.

We are not discussing favorite colors or "opinions" here, we were discussing FACTS to which there is only ONE SIDE, the CORRECT one.

Oh, that's right, you mentioned how the area code is now 585 on your website, thanks.
Love the pictures of your entire family. What an idiot!
A bit of advice, if you are going to be soooo stupid to put out as much info as you do on the web for all of us to see voluntarily, then don't go picking fights with people! Especially in this day and age! You are lucky that I am not a revengeful person. (especially on pathetic idiots like you, I feel sorry for.) But the next person you pick a fight with here may not be so nice!

I have a lot more respect for somebody that does that than I do for somebody who uses a bogus email address when posting on here. If you have so little respect for what your statements that you are unwilling to stand behind them, perhaps you should reconsider posting them.

BTW, on the subject of "Not to bright!", that should be "too" with 2 o's. Now, as you were saying about not too bright...?

And on the subject of what frequencies Part 97 does and doesn't allow amateur radio operators to use in times of emergencies, there exists several conflicting interpretations of that. As I understand it, the ARRL's interpretation is that 97.403 allows amateurs to use any means of AMATEUR communications to request or render assistance. I know, that isn't what it says, but that seems to be the general interpretation. In the past, the FCC has refused to clarify the meaning of 97.403.

Several years ago, a ham hiker (in California) used his modded 2 meter HT to call for help for a friend, badly injured in a fall, on the sheriff's office repeater, after failing to make contact with anyone on the local ham repeaters. The County Board of Supervisors presented him with an award for heroism, and the Sheriff confiscated his radio and filed legal charges against him for unlawful use of the radio. (I believe the charges were filed at the County, not Federal, level, and the judge refused to dismiss the charges.) Only after the Board of Supervisors intervened on his behalf were the charges dropped. The Sheriff refused to return the confiscated radio to the ham, but did relinquish it to the County Board, who then gave it back to the ham. But the Sheriff made it plain that the next time, the ham WOULD go to jail, as he had been warned.

So be careful when you stand on your "rights", you just might find you don't have any.

I thought about suggesting that (the ammo box) to you, but, have you considered the need for air flow around the radio to cool it when running on high power? I know my DR-610TQ gets pretty warm when running on high power for any length of time, and that's out in the open with plenty of air flow around it. Close it up in a ammo box, even with the lid off, and you're going to cook the finals, for sure.

Something to consider,

Mark

>ANYONE HAVE ANY EXPERIENCE CONNECTING THE CAT OUTPUT OF 847 TO SERIAL PORT
>ON A LAPTOP. SOMETHING IS NOT GOING WELL.

As I am currently researching that rig (for purchase), I have read quite a bit of info on the unit...if I remember correctly, you need a null modem cable to connect to the PC serial port....not a straight connect cable. Radio Shack has null modem adapters (which go in the line between the PC and the cable). Hope this is the problem!

Andrew
(PS. How do you like your FT847 so far? Tnx!)

There were several versions of battery packs made for the u2AT. The AC wall charger puts out 12V, but only at about 50mA. Your car cord is capable of several amps. That should not be used as a constant source of power, since NiCds don't like to be continuously charged. Icom made a battery eliminator pack. If you are going to use the rig as a mobile unit, then I'd suggest building a battery eliminator from an old battery pack by putting an appropriate regulator in it and leaving the batteries out. I have one, I'll try to remember to check the voltage on it and get back to you.

Sarah:
Not trying to be inflammatory,God knows you've done a thorough job
of that ! Just to try to maintain a little respect and professionalism that
this hobby (not a paradox if you compare to "the other" communications
hobby), professes to maintain,and has been my experience in my short time
in the hobby (2 years),and the majority of hams have maintained in this
"discussion".
I am addressing you as a ham since you are (persistently) posting to this
NG/discussion.
With that presumption I would also presume .as a ham , that you do get on
the bands.In doing so as a licensed ham you ID every 10 minutes or so as
required.
You criticized one of the hams for his openness on the net.
I tend to agree with you on the "degree of openness" but that is only my
opinion but also his choice.
No one has asked you to divulge any personal info,but as a courtesy to your
fellow hams in the discussion who have ID'd and consequently divulged there
qualifications to comment by giving there CALL SIGNS.
Have you heard of QRZ look up,amongst others ? If not
Then it is to late for you to maintain your privacy on the air.So what is
the difference here ?
Gee I said all of this without calling a single name,hmm
I do admire and appreciate A LADY,WHEN I see one.
73, Dennis, KB1EKU
Its OK ,look up my call,I don't mind and I bet no one will kidnap me or
blow up my rig.

I'm going somewhat from memory here but from looking at the battery sheet that came with my -u2AT I'd say it has a maximum voltage of 10.8 (which is what's supplied by the BP-24 battery). At that voltage the specified RF output power is 2.6w. There is an adapter for the micro series radios that allows use of the IC-2 batteries (BP-2, BP-3, etc.) I've got one somewhere but I can't locate it at the moment. It includes overvoltage protection since the IC-2 series radios could accept up to 13.2 volt batteries (BP-7). Putting one of these on a micro without the protection circuitry would presumably zap something.

I just measured my DC-25 adapter - it takes 13.8v in and puts out 9.8v no-load.

First off, unless the "crime" was committed on federal property I don't
understand how according to the Tenth Amendment "federal" charges can be
filed within the jurisdiction of a sovereign state, not to mention that they
must be filed by federal authorities to begin with. FCC rules are not laws,
but regulations and as such should carry no criminal penalties..

Second, though I live in California, I am unaware of any state law which
prohibits "unlawful" use of a radio transmitter, unless this falls under the
guise of section 653t, interference with emergency CB communications.

And under what authority did the sheriff confiscate the radio? Do they also
confiscate your car when you get caught speeding, or confiscate your stereo
when a neighbor complains about the noise?

Some of you people take way too much for granted..

> Only after the Board of Supervisors intervened on his behalf
> were the charges dropped. The Sheriff refused to return the confiscated

I trust that Oklahoma has more detailed laws regarding EM radio interference
than does California, cuz I couldn't find hardly a relevant PC section..

> So be careful when you stand on your "rights", you just might find you don't
> have any.

You also might be surprised to find out that you have a lot more rights than
they're telling you, and if you sit back in ignorance and assume that it's
legal, they'll take advantage of whatever you allow them to get away with..

I dunno. For obvious reasons i'm not gonna post my personal information on
the net, but I use an alias not because i'm worried about people knowing my
identity, but because it ain't most people's business who I am. If I get
into a disagreement with a local that can't be resolved over the internet, I
just invite them to an eyeball where we can discuss it more intimately and
in depth, though 99% of them will never go for it. If they do, and we end
up being friends, then i'll introduce myself by my given name..

It separates the men from the boys..

What you need is a standard modem cable. Set the serial port settings to match the rig, 9600 baud, 8 start bits, 2 stop bits, no parity. I have no problems working with my 847 and various programs including Log-eqf, win-eqf or even CT.

I'm not sure what you're point is, Sarah. I neither started a fight nor
do I wish to fight. Heck, I don't even know you. You've accomplished the
impossible by divining my name from a publicly available source (Perfect!
It's just as I'd planned. In three more days we'll attack Alderan and crush
the remnants of the rebel fleet...:) and it sounds like you're issuing some
kind of veiled, non-credible threat that doesn't concern me. Search further
and you'll find that I like to tinker with my car, want to learn to play the
piano and am often quiet in large groups of people. But, there are 100's of
people with more than those pearls of wisdom who are close enough to me who
could do more than throw anonymous e-mail barbs and talk trash.
I won't explain my reasons for introducing myself in conversation other
than say it's a pretty common courtesy. My Grandfather told me, "Son, Never
fight with a pig..." ("Close with Grandfather", another note for that
psychological profile/shrine you're building for me in your basement).
Bottom line: I don't want to clot the NG with any more of your abusive
garbage. So, if you don't want me to know you, go away and we won't miss
you. If you still feel the need to talk about this, I invite you to give me
a personal phone call (You already got my number. Odd that I haven't
received a vision of your call).
Sincerely,
//Drink//

I have had DSL for almost a year and never have had any problems on
any bands when running up to 700 watts. That is as hight as my
amplifier will go.

8279. TS-60 Question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-12-31 17:14:24 UTC
From: n1mie@NOSPAM.snet.net
Message-ID: <n1mie-3112011214250001@10.0.1.2>
Source record: 49633

I have a TS-60, which I've used on and off over the years. I'm thinking of getting a better microphone then the stock MC-43S. Are there any other compatible mics that come recommended? I notice the Kenwood choices are pretty limited. I was thinking of a Heil, but there are some many choices and I'm not sure what would work well.

Any suggestions?

The IC-2AT, 3AT and 3AT could only accept a maximum of 10.8 volts
also. Higher voltage applied to this series would toast the final amp
which is direct wired to the battery terminals.

The IC-02AT, 03AT and 04AT could accept and use the 13.2 volt BP-7.

No, I just said his radio is legal. I'm not concerned with legal technicalities.
Being as the cop is disabled, all that goes out the window. My point was, being as the cops radio is certified, and mine is not, I'd rather use his. It's going to be much easier to explain me hopping into his car to call the dispatch, than it will be to explain how I did it with my "modified" radio. To boil it down into words everyone here can understand, it's very,very,very, unlikely I'd ever use my own radio to talk on PD freq. I don't care what the problem is. I'll use a cell phone before I ever do that. You go to jail for that crap in this town. I don't have time to explain to the local rednecks how it was an emergency. I personally know a young guy who about 3 years ago was fixing to be a cop. He had finished the acadamy, etc, and was looking for a job. He was in the habit of carrying in his a car a motorola "sabre" radio which can be used on their frequencies. Of course, he never actually talked on it on the PD freq, but he kept it in his car as an emergency radio. He talked on his "ham" radio.Well, one night his car broke down, and he caught a ride with a friend to an auto parts store to get a part. When he came back, the cops had stopped at his car, and were checking it out. They noticed the sabre radio sitting on the seat, and asked him what was it for. He told them. They threw his ass in jail just for possessing it because it was able to transmit on their frequencies. Sure, after a load of crap and brain damage, he finally got out, but this caused problems for him as a future cop as he had then been arrested. They caused him all kinds of hell and grief over nothing but a handheld sabre radio that he never even turned on. Why did they give him so much crap? Because a "bootlegger" had been jamming HPD frequencies in the weeks before that time, and they thought it might have been him doing it. They roasted his ass like a thanksgiving yardbird. Thanks, but no thanks....I'll just have to let the people die in an emergency before I go though that that crap, if I can't find a method other than my radio. Sorry..
But, of course, I have a cell phone. :) MK

You need to get transmit lined up with receive. It's been years since
I've seen one, but there is an adjustment inside the rig, up near the
front to adjust that. MK

My personal preference is the Astatic D104 mobile mic. I use it with my
FT900 mobile and am constantly getting unsolicited audio reports.

Joe,

First off, I'm just telling you what I read in several magazines at the time, including Monitoring Times, and I believe CQ-VHF. If you don't like the facts as presented, then you need to check the original sources. This was not just a rumor-type thing, the events spanned several months time and were reported in subsequent issues.

Second, I believe most states have laws regarding interfering with public safety personnel in the performance of their duties. In fact, several months ago, somebody was interfering with police communications in a suburb of Okla. City (Mustang, OK), and the police spokesman that was interviewed on TV news said if the person was caught, charges would be filed for interfering with police communications, a state law. It seems to me that there was a former ham arrested last year for interfering with police communications out in CA, in the Los Angles area, as I recall. Nor did I say that Federal charges were filed, in fact I made the point that the charges were filed at the county level, what we in Oklahoma would call District Court. As for how the sheriff justified confiscating the radio, find out who the sheriff was and ask him, I'm not defending him, just telling you what happened. As I recall, the day following the incident, the sheriff asked the young man and his parents to come to the office and demonstrate the radio. When the young man did so, the sheriff confiscated the radio. This was in northern CA, as I recall. And as for FCC regulations not carrying any criminal penalties, you'd better check again, as it seems that several of the illegal low power FM "Pirates" have been fined and threatened with jail time if they continued to operate illegally. Many government agencies issue regulations that have the weight of law (look at the EPA and OSHA). Break them and they can, and will, through your ass in jail.

I'm not saying what happened is right, just telling you what transpired. My point is, until this issue is ruled on by the courts or a clarification is issued by the FCC, then you could get in trouble if you assume that 97.403 is going to protect you if you operate out-of-band in an emergency. If you can afford the lawyers, and are willing to go through the legal hassles in order to set a precedent, then, by all means, go right ahead. It could cost you a couple of hundred thousand dollars and several years time, and then the courts might rule against you. It's kinda where the "rights" meet the "might". A morally indignant attitude isn't going to accomplish much unless you have a good lawyer and a deep pocket.

Mark

New stuff has been added to the Shameless Unabashed Trading Page at
http://www.ParisMtnSignCo.com/Trading.htm

Some prices also been reduced.

Cheers and Happy New Year

If you're a ham, a cop, and a voluteer fireman, is it really so hard
to walk around with three large HTs strapped to you? Hell yes it is.

>And I *don't* like smartasses..

I don't much care for cowardly anonymous dumbasses, either.

Heck, I've been wanting to get one of those super-tall-forklift
thiniges, or a used fire ladder truck. Just imagine how popular it'd
be on field day as a mobile tower.

Now that I think about it, I remember someone posting about making a
boating enclosure for a full-DIN mobile rig out of Lexan and the
silicone they use to glue aquariums (aquaria?) together. He had three
bulkhead connectors on the back for the coax, with waterproofed power
passthroughs to a bus bar on the inside, a 1/8" male-female patch cord
sealed into the panel for the external speaker, and some of that
instant gasket material where the lid came down. If you bend the
Lexan to make the box, you'll only have two glued seams (the final
corner of the open-ended box, and where the back part meets it) and
one gasketed seal. Lexan bending instructions are available on the
web.

The radio sat far enough back in it that the mic could be set in front
of it, eliminating the need for a passthrough there. IIRC, the lid
just used a jewelery-box latch, though you could get creative and use
a bar-and-padlock arrangement to secure the radio against theft or
unathorized use, as well.

Since a lot of current rigs are neither as tall nor as wide as a
half-DIN slot, you might even be able to work out something that fits
nicely in the dash.

This vintage of gear was never intended to operate PSK. The transceiver has to be rock stable so unless you intend to do several modifications to it, I suggest give up and use a more modern rig. The VFO in the FT-101 is not stable enough.

Sorry for the bad news.
